 q + a2*q^2 + (-a2 + 1)*q^3 + q^4 - q^5 + O(q^6)]
```

canonical_parameters(*group, level, weight, base_ring*)

Given a group, level, weight, and base_ring as input by the user, return a canonicalized version of them, where level is a Sage integer, group really is a group, weight is a Sage integer, and base_ring a Sage ring. Note that we can't just get the level from the group, because we have the convention that the character for Gamma1(N) is None (which makes good sense).

INPUT:

- `group` - int, long, Sage integer, group, dirichlet character, or
- `level` - int, long, Sage integer, or group
- `weight` - coercible to Sage integer
- `base_ring` - commutative Sage ring

OUTPUT:

- `level` - Sage integer
- `group` - congruence subgroup
- `weight` - Sage integer
- `ring` - commutative Sage ring

EXAMPLES:

```
sage: from sage.modular.modform.constructor import canonical_parameters
sage: v = canonical_parameters(5, 5, int(7), ZZ); v
(5, Congruence Subgroup Gamma0(5), 7, Integer Ring)
sage: type(v[0]), type(v[1]), type(v[2]), type(v[3])
(<type 'sage.rings.integer.Integer'>,
 <class 'sage.modular.arithgroup.congroup_gamma0.Gamma0_class'>,
 <type 'sage.rings.integer.Integer'>,
 <type 'sage.rings.integer_ring.IntegerRing_class'>)
```

```
sage: canonical_parameters( 5, 7, 7, ZZ )
...
ValueError: group and level do not match.
```

parse_label(*s*)

Given a string s corresponding to a newform label, return the corresponding group and index.

EXAMPLES:

```
sage: sage.modular.modform.constructor.parse_label('11a')
(Congruence Subgroup Gamma0(11), 0)
sage: sage.modular.modform.constructor.parse_label('11aG1')
(Congruence Subgroup Gamma1(11), 0)
sage: sage.modular.modform.constructor.parse_label('11wG1')
(Congruence Subgroup Gamma1(11), 22)
```

45.2 Generic spaces of modular forms

EXAMPLES (computation of base ring): Return the base ring of this space of modular forms.

EXAMPLES: For spaces of modular forms for $\Gamma_0(N)$ or $\Gamma_1(N)$, the default base ring is $\mathbf{Q}$:

```
sage: ModularForms(11,2).base_ring()
Rational Field
sage: ModularForms(1,12).base_ring()
Rational Field
sage: CuspForms(Gamma1(13),3).base_ring()
Rational Field
```

The base ring can be explicitly specified in the constructor function.

```
sage: ModularForms(11,2,base_ring=GF(13)).base_ring()
Finite Field of size 13
```

For modular forms with character the default base ring is the field generated by the image of the character.

```
sage: ModularForms(DirichletGroup(13).0,3).base_ring()
Cyclotomic Field of order 12 and degree 4
```

For example, if the character is quadratic then the field is $\mathbf{Q}$ (if the characteristic is 0).

```
sage: ModularForms(DirichletGroup(13).0^6,3).base_ring()
Rational Field
```

An example in characteristic 7:

```
sage: ModularForms(13,3,base_ring=GF(7)).base_ring()
Finite Field of size 7
```

class ModularFormsSpace(*group, weight, character, base_ring*)

A generic space of modular forms.

base_extend(*base_ring*)

Return the base extension of self to base_ring.

EXAMPLES:

```
sage: M = ModularForms(11,2) ; M
Modular Forms space of dimension 2 for Congruence Subgroup Gamma0(11) of weight 2 over Ratio
sage: M.base_extend(CyclotomicField(5))
Modular Forms space of dimension 2 for Congruence Subgroup Gamma0(11) of weight 2 over Cyclo
```

basis()

Return a basis for self.

EXAMPLES:

```
sage: MM = ModularForms(11,2)
sage: MM.basis()
[
q - 2*q^2 - q^3 + 2*q^4 + q^5 + O(q^6),
1 + 12/5*q + 36/5*q^2 + 48/5*q^3 + 84/5*q^4 + 72/5*q^5 + O(q^6)
]
```

change_ring(*R*)

Change the base ring of this space of modular forms.

TODO: Write this function.

EXAMPLES:

```
sage: sage.modular.modform.space.ModularFormsSpace(Gamma0(11),2,DirichletGroup(1).0,QQ).char
...
NotImplementedError: This function has not yet been implemented.
```

character()

Return the Dirichlet character of this space.

EXAMPLES:

```
sage: M = ModularForms(DirichletGroup(11).0, 3)
sage: M.character()
[zeta10]
sage: s = M.cuspidal_submodule()
sage: s.character()
[zeta10]
sage: CuspForms(DirichletGroup(11).0,3).character()
[zeta10]
```

cuspidal_submodule()

Return the cuspidal submodule of self.

EXAMPLES:

```
sage: N = ModularForms(6,4) ; N
Modular Forms space of dimension 5 for Congruence Subgroup Gamma0(6) of weight 4 over Ration
sage: N.eisenstein_subspace().dimension()
4

sage: N.cuspidal_submodule()
Cuspidal subspace of dimension 1 of Modular Forms space of dimension 5 for Congruence Subgro

sage: N.cuspidal_submodule().dimension()
1
```

cuspidal_subspace()

Synonym for cuspidal_submodule.

EXAMPLES:

```
sage: N = ModularForms(6,4) ; N
Modular Forms space of dimension 5 for Congruence Subgroup Gamma0(6) of weight 4 over Ration
sage: N.eisenstein_subspace().dimension()
4

sage: N.cuspidal_subspace()
Cuspidal subspace of dimension 1 of Modular Forms space of dimension 5 for Congruence Subgro

sage: N.cuspidal_submodule().dimension()
1
```

decomposition()

This function returns a list of submodules $V(f_i, t)$ corresponding to newforms f_i of some level dividing the level of self, such that the direct sum of the submodules equals self, if possible. The space $V(f_i, t)$ is the image under $g(q)$ maps to $g(q^t)$ of the intersection with $R[[q]]$ of the space spanned by the conjugates of f_i, where R is the base ring of self.

TODO: Implement this function.

EXAMPLES:

```
sage: M = ModularForms(11,2); M.decomposition()
...
NotImplementedError
```

echelon_basis()

Return a basis for self in reduced echelon form. This means that if we view the q-expansions of the basis as defining rows of a matrix (with infinitely many columns), then this matrix is in reduced echelon form.

EXAMPLES:

```
sage: M = ModularForms(Gamma0(11),4)
sage: M.echelon_basis()
[
1 + O(q^6),
q - 9*q^4 - 10*q^5 + O(q^6),
q^2 + 6*q^4 + 12*q^5 + O(q^6),
q^3 + q^4 + q^5 + O(q^6)
]
sage: M.cuspidal_subspace().echelon_basis()
[
q + 3*q^3 - 6*q^4 - 7*q^5 + O(q^6),
q^2 - 4*q^3 + 2*q^4 + 8*q^5 + O(q^6)
]

sage: M = ModularForms(SL2Z, 12)
sage: M.echelon_basis()
[
1 + 196560*q^2 + 16773120*q^3 + 398034000*q^4 + 4629381120*q^5 + O(q^6),
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 + O(q^6)
]

sage: M = CuspForms(Gamma0(17),4, prec=10)
sage: M.echelon_basis()
[
q + 2*q^5 - 8*q^7 - 8*q^8 + 7*q^9 + O(q^10),
q^2 - 3/2*q^5 - 7/2*q^6 + 9/2*q^7 + q^8 - 4*q^9 + O(q^10),
q^3 - 2*q^6 + q^7 - 4*q^8 - 2*q^9 + O(q^10),
q^4 - 1/2*q^5 - 5/2*q^6 + 3/2*q^7 + 2*q^9 + O(q^10)
]
```

echelon_form()

Return a space of modular forms isomorphic to self but with basis of q-expansions in reduced echelon form.

This is useful, e.g., the default basis for spaces of modular forms is rarely in echelon form, but echelon form is useful for quickly recognizing whether a q-expansion is in the space.

EXAMPLES: We first illustrate two ambient spaces and their echelon forms.

```
sage: M = ModularForms(11)
sage: M.basis()
[
q - 2*q^2 - q^3 + 2*q^4 + q^5 + O(q^6),
1 + 12/5*q + 36/5*q^2 + 48/5*q^3 + 84/5*q^4 + 72/5*q^5 + O(q^6)
]
sage: M.echelon_form().basis()
[
1 + 12*q^2 + 12*q^3 + 12*q^4 + 12*q^5 + O(q^6),
q - 2*q^2 - q^3 + 2*q^4 + q^5 + O(q^6)
]

sage: M = ModularForms(Gamma1(6),4)
sage: M.basis()
[
q - 2*q^2 - 3*q^3 + 4*q^4 + 6*q^5 + O(q^6),
1 + O(q^6),
q - 8*q^4 + 126*q^5 + O(q^6),
q^2 + 9*q^4 + O(q^6),
q^3 + O(q^6)
]
sage: M.echelon_form().basis()
[
1 + O(q^6),
q + 94*q^5 + O(q^6),
q^2 + 36*q^5 + O(q^6),
q^3 + O(q^6),
q^4 - 4*q^5 + O(q^6)
]
```

We create a space with a funny basis then compute the corresponding echelon form.

```
sage: M = ModularForms(11,4)
sage: M.basis()
[
q + 3*q^3 - 6*q^4 - 7*q^5 + O(q^6),
q^2 - 4*q^3 + 2*q^4 + 8*q^5 + O(q^6),
1 + O(q^6),
q + 9*q^2 + 28*q^3 + 73*q^4 + 126*q^5 + O(q^6)
]
sage: F = M.span_of_basis([M.0 + 1/3*M.1, M.2 + M.3]); F.basis()
[
q + 1/3*q^2 + 5/3*q^3 - 16/3*q^4 - 13/3*q^5 + O(q^6),
1 + q + 9*q^2 + 28*q^3 + 73*q^4 + 126*q^5 + O(q^6)
]
sage: E = F.echelon_form(); E.basis()
[
1 + 26/3*q^2 + 79/3*q^3 + 235/3*q^4 + 391/3*q^5 + O(q^6),
q + 1/3*q^2 + 5/3*q^3 - 16/3*q^4 - 13/3*q^5 + O(q^6)
]
```

eisenstein_series()

Compute the Eisenstein series associated to this space.

Note: This function should be overridden by all derived classes.

EXAMPLES:

```
sage: M = sage.modular.modform.space.ModularFormsSpace(Gamma0(11),2,DirichletGroup(1).0,base
...
NotImplementedError: computation of Eisenstein series in this space not yet implemented
```

eisenstein_submodule()

Return the Eisenstein submodule for this space of modular forms.

EXAMPLES:

```
sage: M = ModularForms(11,2)
sage: M.eisenstein_submodule()
Eisenstein subspace of dimension 1 of Modular Forms space of dimension 2 for Congruence Subg
```

eisenstein_subspace()

Synonym for eisenstein_submodule.

EXAMPLES:

```
sage: M = ModularForms(11,2)
sage: M.eisenstein_subspace()
Eisenstein subspace of dimension 1 of Modular Forms space of dimension 2 for Congruence Subg
```

embedded_submodule()

Return the underlying module of self.

EXAMPLES:

```
sage: N = ModularForms(6,4)
sage: N.dimension()
5

sage: N.embedded_submodule()
Vector space of dimension 5 over Rational Field
```

find_in_space(*f, forms=None, prec=None, indep=True*)

INPUT:

- `f` - a modular form or power series
- `forms` - (default: None) a specific list of modular forms or q-expansions.
- `prec` - if forms are given, compute with them to the given precision
- `indep` - (default: True) whether the given list of forms are assumed to form a basis.

OUTPUT: A list of numbers that give f as a linear combination of the basis for this space or of the given forms if independent=True.

Note: If the list of forms is given, they do *not* have to be in self.

EXAMPLES:

```
sage: M = ModularForms(11,2)
sage: N = ModularForms(10,2)
sage: M.find_in_space( M.basis()[0] )
[1, 0]

sage: M.find_in_space( N.basis()[0], forms=N.basis() )
[1, 0, 0]

sage: M.find_in_space( N.basis()[0] )
...
ArithmeticError: vector is not in free module
```

gen(*n*)

Return the nth generator of self.

EXAMPLES:

```
sage: N = ModularForms(6,4)
sage: N.basis()
[
q - 2*q^2 - 3*q^3 + 4*q^4 + 6*q^5 + O(q^6),
1 + O(q^6),
q - 8*q^4 + 126*q^5 + O(q^6),
q^2 + 9*q^4 + O(q^6),
q^3 + O(q^6)
]

sage: N.gen(0)
q - 2*q^2 - 3*q^3 + 4*q^4 + 6*q^5 + O(q^6)

sage: N.gen(4)
q^3 + O(q^6)

sage: N.gen(5)
...
ValueError: Generator 5 not defined
```

gens()

Return a complete set of generators for self.

EXAMPLES:

```
sage: N = ModularForms(6,4)
sage: N.gens()
[
q - 2*q^2 - 3*q^3 + 4*q^4 + 6*q^5 + O(q^6),
1 + O(q^6),
q - 8*q^4 + 126*q^5 + O(q^6),
q^2 + 9*q^4 + O(q^6),
q^3 + O(q^6)
]
```

group()

Return the congruence subgroup associated to this space of modular forms.

EXAMPLES:

```
sage: ModularForms(Gamma0(12),4).group()
Congruence Subgroup Gamma0(12)

sage: CuspForms(Gamma1(113),2).group()
Congruence Subgroup Gamma1(113)
```

Note that $\Gamma_1(1)$ and $\Gamma_0(1)$ are replaced by $\mathrm{SL}_2(\mathbf{Z})$.

```
sage: CuspForms(Gamma1(1),12).group()
Modular Group SL(2,Z)
sage: CuspForms(SL2Z,12).group()
Modular Group SL(2,Z)
```

has_character()

Return True if this space of modular forms has a specific character.

This is True exactly when the character() function does not return None.

EXAMPLES: A space for $\Gamma_0(N)$ has trivial character, hence has a character.

```
sage: CuspForms(Gamma0(11),2).has_character()
True
```

A space for $\Gamma_1(N)$ (for $N \geq 2$) never has a specific character.

```
sage: CuspForms(Gamma1(11),2).has_character()
False
sage: CuspForms(DirichletGroup(11).0,3).has_character()
True
```

has_coerce_map_from_impl(*from_par*)

Code to make ModularFormsSpace work well with coercion framework.

EXAMPLES:

```
sage: M = ModularForms(22,2)
sage: M.has_coerce_map_from_impl(M.cuspidal_subspace())
True
sage: M.has_coerce_map_from(ModularForms(22,4))
False
```

integral_basis()

Return an integral basis for this space of modular forms.

EXAMPLES: In this example the integral and echelon bases are different.

```
sage: m = ModularForms(97,2,prec=10)
sage: s = m.cuspidal_subspace()
sage: s.integral_basis()
[
q + 2*q^7 + 4*q^8 - 2*q^9 + O(q^10),
q^2 + q^4 + q^7 + 3*q^8 - 3*q^9 + O(q^10),
q^3 + q^4 - 3*q^8 + q^9 + O(q^10),
2*q^4 - 2*q^8 + O(q^10),
q^5 - 2*q^8 + 2*q^9 + O(q^10),
q^6 + 2*q^7 + 5*q^8 - 5*q^9 + O(q^10),
3*q^7 + 6*q^8 - 4*q^9 + O(q^10)
]
sage: s.echelon_basis()
[
q + 2/3*q^9 + O(q^10),
q^2 + 2*q^8 - 5/3*q^9 + O(q^10),
q^3 - 2*q^8 + q^9 + O(q^10),
q^4 - q^8 + O(q^10),
q^5 - 2*q^8 + 2*q^9 + O(q^10),
q^6 + q^8 - 7/3*q^9 + O(q^10),
q^7 + 2*q^8 - 4/3*q^9 + O(q^10)
]
```

Here's another example where there is a big gap in the valuations:

```
sage: m = CuspForms(64,2)
sage: m.integral_basis()
[
q + O(q^6),
q^2 + O(q^6),
q^5 + O(q^6)
]
```

TESTS:

```
sage: m = CuspForms(11*2^4,2, prec=13); m
Cuspidal subspace of dimension 19 of Modular Forms space of dimension 30 for Congruence Subg
```

```
sage: m.integral_basis()          # takes a long time (3 or 4 seconds)
[
q + O(q^13),
q^2 + O(q^13),
q^3 + O(q^13),
q^4 + O(q^13),
q^5 + O(q^13),
q^6 + O(q^13),
q^7 + O(q^13),
q^8 + O(q^13),
q^9 + O(q^13),
q^10 + O(q^13),
q^11 + O(q^13),
q^12 + O(q^13),
O(q^13),
O(q^13),
O(q^13),
O(q^13),
O(q^13),
O(q^13),
O(q^13)
]
```

is_ambient()

Return True if this an ambient space of modular forms.

EXAMPLES:

```
sage: M = ModularForms(Gamma1(4),4)
sage: M.is_ambient()
True

sage: E = M.eisenstein_subspace()
sage: E.is_ambient()
False
```

level()

Return the level of self.

EXAMPLES:

```
sage: M = ModularForms(47,3)
sage: M.level()
47
```

modular_symbols(*sign=0*)

Return the space of modular symbols corresponding to self with the given sign.

EXAMPLES:

```
sage: M = sage.modular.modform.space.ModularFormsSpace(Gamma0(11),2,DirichletGroup(1).0,base
...
NotImplementedError: computation of associated modular symbols space not yet implemented
```

new_submodule(*p=None*)

Return the new submodule of self. If p is specified, return the p-new submodule of self.

Note: This function should be overridden by all derived classes.

EXAMPLES:

```
sage: M = sage.modular.modform.space.ModularFormsSpace(Gamma0(11),2,DirichletGroup(1).0,base
...
NotImplementedError: computation of new submodule not yet implemented
```

new_subspace(*p=None*)

Synonym for new_submodule.

EXAMPLES:

```
sage: M = sage.modular.modform.space.ModularFormsSpace(Gamma0(11),2,DirichletGroup(1).0,base
...
NotImplementedError: computation of new submodule not yet implemented
```

newforms(*names=None*)

Return all newforms in the cuspidal subspace of self.

EXAMPLES:

```
sage: CuspForms(18,4).newforms()
[q + 2*q^2 + 4*q^4 - 6*q^5 + O(q^6)]
sage: CuspForms(32,4).newforms()
[q - 8*q^3 - 10*q^5 + O(q^6), q + 22*q^5 + O(q^6), q + 8*q^3 - 10*q^5 + O(q^6)]
sage: CuspForms(23).newforms('b')
[q + b0*q^2 + (-2*b0 - 1)*q^3 + (-b0 - 1)*q^4 + 2*b0*q^5 + O(q^6)]
sage: CuspForms(23).newforms()
...
ValueError: Please specify a name to be used when generating names for generators of Hecke e
```

prec(*new_prec=None*)

Return or set the default precision used for displaying q-expansions of elements of this space.

INPUT:

- `new_prec` - positive integer (default: None)

OUTPUT: if new_prec is None, returns the current precision.

EXAMPLES:

```
sage: M = ModularForms(1,12)
sage: S = M.cuspidal_subspace()
sage: S.prec()
6
sage: S.basis()
[
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 + O(q^6)
]
sage: S.prec(8)
8
sage: S.basis()
[
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 - 6048*q^6 - 16744*q^7 + O(q^8)
]
```

q_echelon_basis(*prec=None*)

Return the echelon form of the basis of q-expansions of self up to precision prec.

The q-expansions are power series (not actual modular forms). The number of q-expansions returned equals the dimension.

EXAMPLES:

```
sage: M = ModularForms(11,2)
sage: M.q_expansion_basis()
[
q - 2*q^2 - q^3 + 2*q^4 + q^5 + O(q^6),
1 + 12/5*q + 36/5*q^2 + 48/5*q^3 + 84/5*q^4 + 72/5*q^5 + O(q^6)
]
```

```
sage: M.q_echelon_basis()
[
1 + 12*q^2 + 12*q^3 + 12*q^4 + 12*q^5 + O(q^6),
q - 2*q^2 - q^3 + 2*q^4 + q^5 + O(q^6)
]
```

q_expansion_basis(*prec=None*)

Return a sequence of q-expansions for the basis of this space computed to the given input precision.

INPUT:

- `prec` - integer (=0) or None

If prec is None, the prec is computed to be *at least* large enough so that each q-expansion determines the form as an element of this space.

Note: In fact, the q-expansion basis is always computed to *at least* `self.prec()`.

EXAMPLES:

```
sage: S = ModularForms(11,2).cuspidal_submodule()
sage: S.q_expansion_basis()
[
q - 2*q^2 - q^3 + 2*q^4 + q^5 + O(q^6)
]
sage: S.q_expansion_basis(5)
[
q - 2*q^2 - q^3 + 2*q^4 + O(q^5)
]
sage: S = ModularForms(1,24).cuspidal_submodule()
sage: S.q_expansion_basis(8)
[
q + 195660*q^3 + 12080128*q^4 + 44656110*q^5 - 982499328*q^6 - 147247240*q^7 + O(q^8),
q^2 - 48*q^3 + 1080*q^4 - 15040*q^5 + 143820*q^6 - 985824*q^7 + O(q^8)
]
```

q_integral_basis(*prec=None*)

Return a $\mathbf{Z}$-reduced echelon basis of q-expansions for self.

The q-expansions are power series with coefficients in $\mathbf{Z}$; they are *not* actual modular forms.

The base ring of self must be $\mathbf{Q}$. The number of q-expansions returned equals the dimension.

EXAMPLES:

```
sage: S = CuspForms(11,2)
sage: S.q_integral_basis(5)
[
q - 2*q^2 - q^3 + 2*q^4 + O(q^5)
]
```

set_precision(*new_prec*)

Set the default precision used for displaying q-expansions.

INPUT:

- `new_prec` - positive integer

EXAMPLES:

```
sage: M = ModularForms(Gamma0(37),2)
sage: M.set_precision(10)
sage: S = M.cuspidal_subspace()
sage: S.basis()
[
q + q^3 - 2*q^4 - q^7 - 2*q^9 + O(q^10),
```

```
q^2 + 2*q^3 - 2*q^4 + q^5 - 3*q^6 - 4*q^9 + O(q^10)
]

sage: S.set_precision(0)
sage: S.basis()
[
O(q^0),
O(q^0)
]
```

The precision of subspaces is the same as the precision of the ambient space.

```
sage: S.set_precision(2)
sage: M.basis()
[
q + O(q^2),
O(q^2),
1 + 2/3*q + O(q^2)
]
```

The precision must be nonnegative:

```
sage: S.set_precision(-1)
...
ValueError: n (=-1) must be >= 0
```

We do another example with nontrivial character.

```
sage: M = ModularForms(DirichletGroup(13).0^2)
sage: M.set_precision(10)
sage: M.cuspidal_subspace().0
q + (-zeta6 - 1)*q^2 + (2*zeta6 - 2)*q^3 + zeta6*q^4 + (-2*zeta6 + 1)*q^5 + (-2*zeta6 + 4)*q
```

span(*B*)

Take a set B of forms, and return the subspace of self with B as a basis.

EXAMPLES:

```
sage: N = ModularForms(6,4) ; N
Modular Forms space of dimension 5 for Congruence Subgroup Gamma0(6) of weight 4 over Ration

sage: N.span_of_basis([N.basis()[0]])
Modular Forms subspace of dimension 1 of Modular Forms space of dimension 5 for Congruence S

sage: N.span_of_basis([N.basis()[0], N.basis()[1]])
Modular Forms subspace of dimension 2 of Modular Forms space of dimension 5 for Congruence S

sage: N.span_of_basis( N.basis() )
Modular Forms subspace of dimension 5 of Modular Forms space of dimension 5 for Congruence S
```

span_of_basis(*B*)

Take a set B of forms, and return the subspace of self with B as a basis.

EXAMPLES:

```
sage: N = ModularForms(6,4) ; N
Modular Forms space of dimension 5 for Congruence Subgroup Gamma0(6) of weight 4 over Ration

sage: N.span_of_basis([N.basis()[0]])
Modular Forms subspace of dimension 1 of Modular Forms space of dimension 5 for Congruence S
```

```
sage: N.span_of_basis([N.basis()[0], N.basis()[1]])
Modular Forms subspace of dimension 2 of Modular Forms space of dimension 5 for Congruence S

sage: N.span_of_basis( N.basis() )
Modular Forms subspace of dimension 5 of Modular Forms space of dimension 5 for Congruence S
```

sturm_bound(*M=None*)

For a space M of modular forms, this function returns an integer B such that two modular forms in either self or M are equal if and only if their q-expansions are equal to precision B (note that this is 1+ the usual Sturm bound, since $O(q^{\text{prec}})$ has precision prec). If M is none, then M is set equal to self.

EXAMPLES:

```
sage: S37=CuspForms(37,2)
sage: S37.sturm_bound()
8
sage: M = ModularForms(11,2)
sage: M.sturm_bound()
3
sage: ModularForms(Gamma1(15),2).sturm_bound()
33
```

Note: Reference for the Sturm bound that we use in the definition of of this function:

J. Sturm, On the congruence of modular forms, Number theory (New York, 1984-1985), Springer, Berlin, 1987, pp. 275-280.

Useful Remark:

Kevin Buzzard pointed out to me (William Stein) in Fall 2002 that the above bound is fine for Gamma1 with character, as one sees by taking a power of f. More precisely, if $f \cong 0 \pmod{p}$ for first s coefficients, then $f^r = 0 \pmod{p}$ for first sr coefficients. Since the weight of f^r is $r$weight(f), it follows that if $s \geq$ the sturm bound for Γ_0 at weight(f), then f^r has valuation large enough to be forced to be 0 at $r\cdot$ weight(f) by Sturm bound (which is valid if we choose r right). Thus $f \cong 0 \pmod{p}$. Conclusion: For Γ_1 with fixed character, the Sturm bound is *exactly* the same as for Γ_0. A key point is that we are finding $\mathbf{Z}[\varepsilon]$ generators for the Hecke algebra here, not $\mathbf{Z}$-generators. So if one wants generators for the Hecke algebra over $\mathbf{Z}$, this bound is wrong.

This bound works over any base, even a finite field. There might be much better bounds over $\mathbf{Q}$, or for comparing two eigenforms.

weight()

Return the weight of this space of modular forms.

EXAMPLES:

```
sage: M = ModularForms(Gamma1(13),11)
sage: M.weight()
11

sage: M = ModularForms(Gamma0(997),100)
sage: M.weight()
100

sage: M = ModularForms(Gamma0(97),4)
sage: M.weight()
4
sage: M.eisenstein_submodule().weight()
4
```

contains_each(*V, B*)

Determine whether or not V contains every element of B. Used here for linear algebra, but works very generally.

EXAMPLES:

```
sage: contains_each = sage.modular.modform.space.contains_each
sage: contains_each( range(20), prime_range(20) )
True
sage: contains_each( range(20), range(30) )
False
```

is_ModularFormsSpace(x)

Return True if x is a `'ModularFormsSpace'`.

EXAMPLES:

```
sage: from sage.modular.modform.space import is_ModularFormsSpace
sage: is_ModularFormsSpace(ModularForms(11,2))
True
sage: is_ModularFormsSpace(CuspForms(11,2))
True
sage: is_ModularFormsSpace(3)
False
```

45.3 Ambient Spaces of Modular Forms.

EXAMPLES:

We compute a basis for the ambient space $M_2(\Gamma_1(25), \chi)$, where χ is quadratic.

```
sage: chi = DirichletGroup(25,QQ).0; chi
[-1]
sage: n = ModularForms(chi,2); n
Modular Forms space of dimension 6, character [-1] and weight 2 over Rational Field
sage: type(n)
<class 'sage.modular.modform.ambient_eps.ModularFormsAmbient_eps'>
```

Compute a basis:

```
sage: n.basis()
[
1 + O(q^6),
q + O(q^6),
q^2 + O(q^6),
q^3 + O(q^6),
q^4 + O(q^6),
q^5 + O(q^6)
]
```

Compute the same basis but to higher precision:

```
sage: n.set_precision(20)
sage: n.basis()
[
1 + 10*q^10 + 20*q^15 + O(q^20),
q + 5*q^6 + q^9 + 12*q^11 - 3*q^14 + 17*q^16 + 8*q^19 + O(q^20),
q^2 + 4*q^7 - q^8 + 8*q^12 + 2*q^13 + 10*q^17 - 5*q^18 + O(q^20),
q^3 + q^7 + 3*q^8 - q^12 + 5*q^13 + 3*q^17 + 6*q^18 + O(q^20),
q^4 - q^6 + 2*q^9 + 3*q^14 - 2*q^16 + 4*q^19 + O(q^20),
```

```
q^5 + q^10 + 2*q^15 + O(q^20)
]
```

TESTS:

```
sage: m = ModularForms(Gamma1(20),2,GF(7))
sage: loads(dumps(m)) == m
True
```

```
sage: m = ModularForms(GammaH(11,[2]), 2); m
Modular Forms space of dimension 2 for Congruence Subgroup Gamma_H(11) with H generated by [2] of wei
sage: type(m)
<class 'sage.modular.modform.ambient.ModularFormsAmbient'>
```

class ModularFormsAmbient(*group, weight, base_ring, character=None*)

An ambient space of modular forms.

ambient_space()

Return the ambient space that contains this ambient space. This is, of course, just this space again.

EXAMPLES:

```
sage: m = ModularForms(Gamma0(3),30)
sage: m.ambient_space() is m
True
```

change_ring(*base_ring*)

Change the base ring of this space of modular forms.

INPUT:

- R - ring

EXAMPLES:

```
sage: M = ModularForms(Gamma0(37),2)
sage: M.basis()
[
q + q^3 - 2*q^4 + O(q^6),
q^2 + 2*q^3 - 2*q^4 + q^5 + O(q^6),
1 + 2/3*q + 2*q^2 + 8/3*q^3 + 14/3*q^4 + 4*q^5 + O(q^6)
]
```

The basis after changing the base ring is the reduction modulo 3 of an integral basis.

```
sage: M3 = M.change_ring(GF(3))
sage: M3.basis()
[
1 + q^3 + q^4 + 2*q^5 + O(q^6),
q + q^3 + q^4 + O(q^6),
q^2 + 2*q^3 + q^4 + q^5 + O(q^6)
]
```

cuspidal_submodule()

Return the cuspidal submodule of this ambient module.

EXAMPLES:

```
sage: ModularForms(Gamma1(13)).cuspidal_submodule()
Cuspidal subspace of dimension 2 of Modular Forms space of dimension 13 for
Congruence Subgroup Gamma1(13) of weight 2 over Rational Field
```

dimension()

Return the dimension of this ambient space of modular forms, computed using a dimension formula (so it should be reasonably fast).

EXAMPLES:

```
sage: m = ModularForms(Gamma1(20),20)
sage: m.dimension()
238
```

eisenstein_params()

Return parameters that define all Eisenstein series in self.

OUTPUT: an immutable Sequence

EXAMPLES:

```
sage: m = ModularForms(Gamma0(22), 2)
sage: v = m.eisenstein_params(); v
[([1], [1], 2), ([1], [1], 11), ([1], [1], 22)]
sage: type(v)
<class 'sage.structure.sequence.Sequence'>
```

eisenstein_series()

Return all Eisenstein series associated to this space.

```
sage: ModularForms(27,2).eisenstein_series()
[
q^3 + O(q^6),
q - 3*q^2 + 7*q^4 - 6*q^5 + O(q^6),
1/12 + q + 3*q^2 + q^3 + 7*q^4 + 6*q^5 + O(q^6),
1/3 + q + 3*q^2 + 4*q^3 + 7*q^4 + 6*q^5 + O(q^6),
13/12 + q + 3*q^2 + 4*q^3 + 7*q^4 + 6*q^5 + O(q^6)
]

sage: ModularForms(Gamma1(5),3).eisenstein_series()
[
-1/5*zeta4 - 2/5 + q + (4*zeta4 + 1)*q^2 + (-9*zeta4 + 1)*q^3 + (4*zeta4 - 15)*q^4 + q^5 + O
q + (zeta4 + 4)*q^2 + (-zeta4 + 9)*q^3 + (4*zeta4 + 15)*q^4 + 25*q^5 + O(q^6),
1/5*zeta4 - 2/5 + q + (-4*zeta4 + 1)*q^2 + (9*zeta4 + 1)*q^3 + (-4*zeta4 - 15)*q^4 + q^5 + O
q + (-zeta4 + 4)*q^2 + (zeta4 + 9)*q^3 + (-4*zeta4 + 15)*q^4 + 25*q^5 + O(q^6)
]

sage: eps = DirichletGroup(13).0^2
sage: ModularForms(eps,2).eisenstein_series()
[
-7/13*zeta6 - 11/13 + q + (2*zeta6 + 1)*q^2 + (-3*zeta6 + 1)*q^3 + (6*zeta6 - 3)*q^4 - 4*q^5
q + (zeta6 + 2)*q^2 + (-zeta6 + 3)*q^3 + (3*zeta6 + 3)*q^4 + 4*q^5 + O(q^6)
]
```

eisenstein_submodule()

Return the Eisenstein submodule of this ambient module.

EXAMPLES:

```
sage: m = ModularForms(Gamma1(13),2); m
Modular Forms space of dimension 13 for Congruence Subgroup Gamma1(13) of weight 2 over Rati
sage: m.eisenstein_submodule()
Eisenstein subspace of dimension 11 of Modular Forms space of dimension 13 for Congruence Su
```

free_module()

hecke_module_of_level(N)

Return the Hecke module of level N corresponding to self, which is the domain or codomain of a degeneracy map from self. Here N must be either a divisor or a multiple of the level of self.

EXAMPLES:

```
sage: ModularForms(25, 6).hecke_module_of_level(5)
Modular Forms space of dimension 3 for Congruence Subgroup Gamma0(5) of weight 6 over Ration
sage: ModularForms(Gamma1(4), 3).hecke_module_of_level(8)
Modular Forms space of dimension 7 for Congruence Subgroup Gamma1(8) of weight 3 over Ration
sage: ModularForms(Gamma1(4), 3).hecke_module_of_level(9)
...
ValueError: N (=9) must be a divisor or a multiple of the level of self (=4)
```

is_ambient()

Return True if this an ambient space of modular forms.

This is an ambient space, so this function always returns True.

EXAMPLES:

```
sage: ModularForms(11).is_ambient()
True
sage: CuspForms(11).is_ambient()
False
```

modular_symbols(*sign=0*)

Return the corresponding space of modular symbols with the given sign.

EXAMPLES:

```
sage: S = ModularForms(11,2)
sage: S.modular_symbols()
Modular Symbols space of dimension 3 for Gamma_0(11) of weight 2 with sign 0 over Rational F
sage: S.modular_symbols(sign=1)
Modular Symbols space of dimension 2 for Gamma_0(11) of weight 2 with sign 1 over Rational F
sage: S.modular_symbols(sign=-1)
Modular Symbols space of dimension 1 for Gamma_0(11) of weight 2 with sign -1 over Rational

sage: ModularForms(1,12).modular_symbols()
Modular Symbols space of dimension 3 for Gamma_0(1) of weight 12 with sign 0 over Rational F
```

module()

Return the underlying free module corresponding to this space of modular forms.

If the dimension of self can be computed reasonably quickly, then this function returns a free module (viewed as a tuple space) of the same dimension as self over the same base ring. Otherwise, the dimension of self.module() may be smaller. For example, in the case of weight 1 forms, in some cases the dimension can't easily be computed so self.module() is of smaller dimension.

EXAMPLES:

```
sage: m = ModularForms(Gamma1(13),10)
sage: m.free_module()
Vector space of dimension 69 over Rational Field
sage: ModularForms(Gamma1(13),4, GF(49,'b')).free_module()
Vector space of dimension 27 over Finite Field in b of size 7^2
```

Note that in the following example the dimension can't be (quickly) computed, so M.module() returns a space of different dimension than M:

```
sage: M = ModularForms(Gamma1(57), 1); M
Modular Forms space of dimension (unknown) for Congruence ...
sage: M.module()
Vector space of dimension 36 over Rational Field
sage: M.basis()
```

```
...
NotImplementedError: Computation of dimensions of weight 1 cusp forms spaces not implemented
```

new_submodule(*p=None*)

Return the new or p-new submodule of this ambient module.

INPUT:

- p - (default: None), if specified return only the p-new submodule.

EXAMPLES:

```
sage: m = ModularForms(Gamma0(33),2); m
Modular Forms space of dimension 6 for Congruence Subgroup Gamma0(33) of weight 2 over Ratio
sage: m.new_submodule()
Modular Forms subspace of dimension 1 of Modular Forms space of dimension 6 for Congruence S
```

Another example:

```
sage: M = ModularForms(17,4)
sage: N = M.new_subspace(); N
Modular Forms subspace of dimension 4 of Modular Forms space of dimension 6 for Congruence S
sage: N.basis()
[
q + 2*q^5 + O(q^6),
q^2 - 3/2*q^5 + O(q^6),
q^3 + O(q^6),
q^4 - 1/2*q^5 + O(q^6)
]

sage: ModularForms(12,4).new_submodule()
Modular Forms subspace of dimension 1 of Modular Forms space of dimension 9 for Congruence S
```

Unfortunately (TODO) - p-new submodules aren't yet implemented:

```
sage: m.new_submodule(3)            # not implemented
...
NotImplementedError
sage: m.new_submodule(11)           # not implemented
...
NotImplementedError
```

prec(*new_prec=None*)

Set or get default initial precision for printing modular forms.

INPUT:

- new_prec - positive integer (default: None)

OUTPUT: if new_prec is None, returns the current precision.

EXAMPLES:

```
sage: M = ModularForms(1,12, prec=3)
sage: M.prec()
3

sage: M.basis()
[
q - 24*q^2 + O(q^3),
1 + 65520/691*q + 134250480/691*q^2 + O(q^3)
]

sage: M.prec(5)
5
```

```
sage: M.basis()
[
q - 24*q^2 + 252*q^3 - 1472*q^4 + O(q^5),
1 + 65520/691*q + 134250480/691*q^2 + 11606736960/691*q^3 + 274945048560/691*q^4 + O(q^5)
]
```

rank()

This is a synonym for `self.dimension()`.

EXAMPLES:

```
sage: m = ModularForms(Gamma0(20),4)
sage: m.rank()
12
sage: m.dimension()
12
```

set_precision(*n*)

Set the default precision for displaying elements of this space.

EXAMPLES:

```
sage: m = ModularForms(Gamma1(5),2)
sage: m.set_precision(10)
sage: m.basis()
[
1 + 60*q^3 - 120*q^4 + 240*q^5 - 300*q^6 + 300*q^7 - 180*q^9 + O(q^10),
q + 6*q^3 - 9*q^4 + 27*q^5 - 28*q^6 + 30*q^7 - 11*q^9 + O(q^10),
q^2 - 4*q^3 + 12*q^4 - 22*q^5 + 30*q^6 - 24*q^7 + 5*q^8 + 18*q^9 + O(q^10)
]
sage: m.set_precision(5)
sage: m.basis()
[
1 + 60*q^3 - 120*q^4 + O(q^5),
q + 6*q^3 - 9*q^4 + O(q^5),
q^2 - 4*q^3 + 12*q^4 + O(q^5)
]
```

45.4 Modular Forms with Character

EXAMPLES:

```
sage: eps = DirichletGroup(13).0
sage: M = ModularForms(eps^2, 2); M
Modular Forms space of dimension 3, character [zeta6] and weight 2 over Cyclotomic Field of order 6 a

sage: S = M.cuspidal_submodule(); S
Cuspidal subspace of dimension 1 of Modular Forms space of dimension 3, character [zeta6] and weight
sage: S.modular_symbols()
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 4 and level 13, weight
```

We create a spaces associated to Dirichlet characters of modulus 225:

```
sage: e = DirichletGroup(225).0
sage: e.order()
6
sage: e.base_ring()
```

```
Cyclotomic Field of order 60 and degree 16
sage: M = ModularForms(e,3)
```

Notice that the base ring is "minimized":

```
sage: M
Modular Forms space of dimension 66, character [zeta6, 1] and weight 3
over Cyclotomic Field of order 6 and degree 2
```

If we don't want the base ring to change, we can explicitly specify it:

```
sage: ModularForms(e, 3, e.base_ring())
Modular Forms space of dimension 66, character [zeta6, 1] and weight 3
over Cyclotomic Field of order 60 and degree 16
```

Next we create a space associated to a Dirichlet character of order 20:

```
sage: e = DirichletGroup(225).1
sage: e.order()
20
sage: e.base_ring()
Cyclotomic Field of order 60 and degree 16
sage: M = ModularForms(e,17); M
Modular Forms space of dimension 484, character [1, zeta20] and
weight 17 over Cyclotomic Field of order 20 and degree 8
```

We compute the Eisenstein subspace, which is fast even though the dimension of the space is large (since an explicit basis of q-expansions has not been computed yet).

```
sage: M.eisenstein_submodule()
Eisenstein subspace of dimension 8 of Modular Forms space of
dimension 484, character [1, zeta20] and weight 17 over Cyclotomic Field of order 20 and degree 8

sage: M.cuspidal_submodule()
Cuspidal subspace of dimension 476 of Modular Forms space of dimension 484, character [1, zeta20] and
```

TESTS:

```
sage: m = ModularForms(DirichletGroup(20).1,5)
sage: m == loads(dumps(m))
True
sage: type(m)
<class 'sage.modular.modform.ambient_eps.ModularFormsAmbient_eps'>
```

class ModularFormsAmbient_eps(*character, weight=2, base_ring=None*)

A space of modular forms with character.

base_extend(*R*)

Return space with same defining parameters as this ambient space of modular symbols, but with scalars extended to a different base ring. This differs from change_ring in that it is always possible to coerce elements of the original space to elements of the new one.

EXAMPLES:

```
sage: m = ModularForms(DirichletGroup(13).0^2,2); m
Modular Forms space of dimension 3, character [zeta6] and weight 2 over Cyclotomic Field of
```

```
sage: m.base_extend(CyclotomicField(12))
Modular Forms space of dimension 3, character [zeta12^2] and weight 2 over Cyclotomic Field
```

change_ring(*base_ring*)

Return space with same defining parameters as this ambient space of modular symbols, but defined over a different base ring.

EXAMPLES:

```
sage: m = ModularForms(DirichletGroup(13).0^2,2); m
Modular Forms space of dimension 3, character [zeta6] and weight 2 over Cyclotomic Field of
sage: m.change_ring(CyclotomicField(12))
Modular Forms space of dimension 3, character [zeta12^2] and weight 2 over Cyclotomic Field
```

It must be possible to change the ring of the underlying Dirichlet character:

```
sage: m.change_ring(QQ)
...
ValueError: cannot coerce element of order 6 into self
```

cuspidal_submodule()

Return the cuspidal submodule of this ambient space of modular forms.

EXAMPLES:

```
sage: eps = DirichletGroup(4).0
sage: M = ModularForms(eps, 5); M
Modular Forms space of dimension 3, character [-1] and weight 5 over Rational Field
sage: M.cuspidal_submodule()
Cuspidal subspace of dimension 1 of Modular Forms space of dimension 3, character [-1] and w
```

eisenstein_submodule()

Return the submodule of this ambient module with character that is spanned by Eisenstein series. This is the Hecke stable complement of the cuspidal submodule.

EXAMPLES:

```
sage: m = ModularForms(DirichletGroup(13).0^2,2); m
Modular Forms space of dimension 3, character [zeta6] and weight 2 over Cyclotomic Field of
sage: m.eisenstein_submodule()
Eisenstein subspace of dimension 2 of Modular Forms space of dimension 3, character [zeta6]
```

hecke_module_of_level(*N*)

Return the Hecke module of level N corresponding to self, which is the domain or codomain of a degeneracy map from self. Here N must be either a divisor or a multiple of the level of self, and a multiple of the conductor of the character of self.

EXAMPLES:

```
sage: M = ModularForms(DirichletGroup(15).0, 3); M.character().conductor()
3
sage: M.hecke_module_of_level(3)
Modular Forms space of dimension 2, character [-1] and weight 3 over Rational Field
sage: M.hecke_module_of_level(5)
...
ValueError: conductor(=3) must divide M(=5)
sage: M.hecke_module_of_level(30)
Modular Forms space of dimension 16, character [-1, 1] and weight 3 over Rational Field
```

modular_symbols(*sign=0*)

Return corresponding space of modular symbols with given sign.

EXAMPLES:

```
sage: eps = DirichletGroup(13).0
sage: M = ModularForms(eps^2, 2)
sage: M.modular_symbols()
Modular Symbols space of dimension 4 and level 13, weight 2, character [zeta6], sign 0, over
sage: M.modular_symbols(1)
Modular Symbols space of dimension 3 and level 13, weight 2, character [zeta6], sign 1, over
sage: M.modular_symbols(-1)
Modular Symbols space of dimension 1 and level 13, weight 2, character [zeta6], sign -1, ove
sage: M.modular_symbols(2)
...
ValueError: sign must be -1, 0, or 1
```

45.5 Modular Forms for $Gamma_0(N)$ over Q.

TESTS: sage: m = ModularForms(Gamma0(389),6) sage: loads(dumps(m)) == m True

class ModularFormsAmbient_g0_Q (*level, weight*)

A space of modular forms for Gamma_0(N) over QQ.

cuspidal_submodule ()

Return the cuspidal submodule of this space of modular forms for $Gamma_0(N)$.

EXAMPLES: sage: m = ModularForms(Gamma0(33),4) sage: s = m.cuspidal_submodule(); s Cuspidal subspace of dimension 10 of Modular Forms space of dimension 14 for Congruence Subgroup Gamma0(33) of weight 4 over Rational Field sage: type(s) <class 'sage.modular.modform.cuspidal_submodule.CuspidalSubmodule_g0_Q'>

eisenstein_submodule ()

Return the Eisenstein submodule of this space of modular forms for $Gamma_0(N)$.

EXAMPLES: sage: m = ModularForms(Gamma0(389),6) sage: m.eisenstein_submodule() Eisenstein subspace of dimension 2 of Modular Forms space of dimension 163 for Congruence Subgroup Gamma0(389) of weight 6 over Rational Field

45.6 Modular Forms for $\Gamma_1(N)$ over Q.

EXAMPLES:

```
sage: M = ModularForms(Gamma1(13),2); M
Modular Forms space of dimension 13 for Congruence Subgroup Gamma1(13) of weight 2 over Rational Fiel
sage: S = M.cuspidal_submodule(); S
Cuspidal subspace of dimension 2 of Modular Forms space of dimension 13 for Congruence Subgroup Gamma
sage: S.basis()
[
q - 4*q^3 - q^4 + 3*q^5 + O(q^6),
q^2 - 2*q^3 - q^4 + 2*q^5 + O(q^6)
]
```

TESTS:

```
sage: m = ModularForms(Gamma1(20),2)
sage: loads(dumps(m)) == m
True
```

class ModularFormsAmbient_g1_Q(*level, weight*)
A space of modular forms for the group $\Gamma_1(N)$ over the rational numbers.

cuspidal_submodule()
Return the cuspidal submodule of this modular forms space.
EXAMPLES:

```
sage: m = ModularForms(Gamma1(17),2); m
Modular Forms space of dimension 20 for Congruence Subgroup Gamma1(17) of weight 2 over Rati
sage: m.cuspidal_submodule()
Cuspidal subspace of dimension 5 of Modular Forms space of dimension 20 for Congruence Subgr
```

eisenstein_submodule()
Return the Eisenstein submodule of this modular forms space.
EXAMPLES:

```
sage: ModularForms(Gamma1(13),2).eisenstein_submodule()
Eisenstein subspace of dimension 11 of Modular Forms space of dimension 13 for Congruence Su
sage: ModularForms(Gamma1(13),10).eisenstein_submodule()
Eisenstein subspace of dimension 12 of Modular Forms space of dimension 69 for Congruence Su
```

45.7 Modular Forms over a Non-minimal Base Ring

class ModularFormsAmbient_R(*M, base_ring*)

cuspidal_submodule()
Return the cuspidal subspace of this space.
EXAMPLE:

```
sage: C = CuspForms(7, 4, base_ring=CyclotomicField(5)) # indirect doctest
sage: type(C)
<class 'sage.modular.modform.cuspidal_submodule.CuspidalSubmodule_R'>
```

45.8 Submodules of spaces of modular forms

EXAMPLES: sage: M = ModularForms(Gamma1(13),2); M Modular Forms space of dimension 13 for Congruence Subgroup Gamma1(13) of weight 2 over Rational Field sage: M.eisenstein_subspace() Eisenstein subspace of dimension 11 of Modular Forms space of dimension 13 for Congruence Subgroup Gamma1(13) of weight 2 over Rational Field sage: M == loads(dumps(M)) True sage: M.cuspidal_subspace() Cuspidal subspace of dimension 2 of Modular Forms space of dimension 13 for Congruence Subgroup Gamma1(13) of weight 2 over Rational Field

class ModularFormsSubmodule(*ambient_module, submodule, dual=None, check=False*)
A submodule of an ambient space of modular forms.

change_ring(*base_ring*)
Return the base change of this subspace of modular forms to base_ring.

EXAMPLES: sage: M = ModularForms(6,4) ; M.cuspidal_subspace().change_ring(GF(3)) Traceback (most recent call last): ... NotImplementedError: Base change only currently implemented for ambient spaces.

class ModularFormsSubmoduleWithBasis(*ambient_module, submodule, dual=None, check=False*)

45.9 The Cuspidal Subspace

EXAMPLES:

```
sage: S = CuspForms(SL2Z,12); S
Cuspidal subspace of dimension 1 of Modular Forms space of dimension 2 for
Modular Group SL(2,Z) of weight 12 over Rational Field
sage: S.basis()
[
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 + O(q^6)
]

sage: S = CuspForms(Gamma0(33),2); S
Cuspidal subspace of dimension 3 of Modular Forms space of dimension 6 for
Congruence Subgroup Gamma0(33) of weight 2 over Rational Field
sage: S.basis()
[
q - q^5 + O(q^6),
q^2 - q^4 - q^5 + O(q^6),
q^3 + O(q^6)
]

sage: S = CuspForms(Gamma1(3),6); S
Cuspidal subspace of dimension 1 of Modular Forms space of dimension 3 for
Congruence Subgroup Gamma1(3) of weight 6 over Rational Field
sage: S.basis()
[
q - 6*q^2 + 9*q^3 + 4*q^4 + 6*q^5 + O(q^6)
]
```

class **CuspidalSubmodule** (*ambient_space*)

Base class for cuspidal submodules of ambient spaces of modular forms.

modular_symbols (*sign=0*)

Return the corresponding space of modular symbols with the given sign.

EXAMPLES:

```
sage: S = ModularForms(11,2).cuspidal_submodule()
sage: S.modular_symbols()
Modular Symbols subspace of dimension 2 of Modular Symbols space
of dimension 3 for Gamma_0(11) of weight 2 with sign 0 over Rational Field

sage: S.modular_symbols(sign=-1)
Modular Symbols subspace of dimension 1 of Modular Symbols space
of dimension 1 for Gamma_0(11) of weight 2 with sign -1 over Rational Field

sage: M = S.modular_symbols(sign=1); M
Modular Symbols subspace of dimension 1 of Modular Symbols space of
dimension 2 for Gamma_0(11) of weight 2 with sign 1 over Rational Field
sage: M.sign()
1

sage: S = ModularForms(1,12).cuspidal_submodule()
sage: S.modular_symbols()
Modular Symbols subspace of dimension 2 of Modular Symbols space of
dimension 3 for Gamma_0(1) of weight 12 with sign 0 over Rational Field

sage: eps = DirichletGroup(13).0
```

```
sage: S = CuspForms(eps^2, 2)

sage: S.modular_symbols(sign=0)
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 4 and level 13

sage: S.modular_symbols(sign=1)
Modular Symbols subspace of dimension 1 of Modular Symbols space of dimension 3 and level 13

sage: S.modular_symbols(sign=-1)
Modular Symbols subspace of dimension 1 of Modular Symbols space of dimension 1 and level 13
```

class CuspidalSubmodule_R(*ambient_space*)
Cuspidal submodule over a non-minimal base ring.

class CuspidalSubmodule_eps(*ambient_space*)
Space of cusp forms with given Dirichlet character.

EXAMPLES:

```
sage: S = CuspForms(DirichletGroup(5).0,5); S
Cuspidal subspace of dimension 1 of Modular Forms space of dimension 3, character [zeta4] and we

sage: S.basis()
[
q + (-zeta4 - 1)*q^2 + (6*zeta4 - 6)*q^3 - 14*zeta4*q^4 + (15*zeta4 + 20)*q^5 + O(q^6)
]
sage: f = S.0
sage: f.qexp()
q + (-zeta4 - 1)*q^2 + (6*zeta4 - 6)*q^3 - 14*zeta4*q^4 + (15*zeta4 + 20)*q^5 + O(q^6)
sage: f.qexp(7)
q + (-zeta4 - 1)*q^2 + (6*zeta4 - 6)*q^3 - 14*zeta4*q^4 + (15*zeta4 + 20)*q^5 + 12*q^6 + O(q^7)
sage: f.qexp(3)
q + (-zeta4 - 1)*q^2 + O(q^3)
sage: f.qexp(2)
q + O(q^2)
sage: f.qexp(1)
O(q^1)
```

class CuspidalSubmodule_g0_Q(*ambient_space*)
Space of cusp forms for $\Gamma_0(N)$ over $\mathbf{Q}$.

class CuspidalSubmodule_g1_Q(*ambient_space*)
Space of cusp forms for $\Gamma_1(N)$ over $\mathbf{Q}$.

class CuspidalSubmodule_level1_Q(*ambient_space*)
Space of cusp forms of level 1 over $\mathbf{Q}$.

class CuspidalSubmodule_modsym_qexp(*ambient_space*)
Cuspidal submodule with q-expansions calculated via modular symbols.

new_submodule(*p=None*)
Return the new subspace of this space of cusp forms. This is computed using modular symbols.

EXAMPLE:

```
sage: CuspForms(55).new_submodule()
Modular Forms subspace of dimension 3 of Modular Forms space of dimension 8 for Congruence S
```

45.10 The Eisenstein Subspace

class **EisensteinSubmodule**(*ambient_space*)

The Eisenstein submodule of an ambient space of modular forms.

eisenstein_submodule()

Return the Eisenstein submodule of self. (Yes, this is just self.)

EXAMPLES:

```
sage: E = ModularForms(23,4).eisenstein_subspace()
sage: E == E.eisenstein_submodule()
True
```

modular_symbols(*sign=0*)

Return the corresponding space of modular symbols with given sign. This will fail in weight 1.

Warning: If sign != 0, then the space of modular symbols will, in general, only correspond to a *subspace* of this space of modular forms. This can be the case for both sign +1 or -1.

EXAMPLES:

```
sage: E = ModularForms(11,2).eisenstein_submodule()
sage: M = E.modular_symbols(); M
Modular Symbols subspace of dimension 1 of Modular Symbols space
of dimension 3 for Gamma_0(11) of weight 2 with sign 0 over Rational Field
sage: M.sign()
0

sage: M = E.modular_symbols(sign=-1); M
Modular Symbols subspace of dimension 0 of Modular Symbols space of
dimension 1 for Gamma_0(11) of weight 2 with sign -1 over Rational Field

sage: E = ModularForms(1,12).eisenstein_submodule()
sage: E.modular_symbols()
Modular Symbols subspace of dimension 1 of Modular Symbols space of
dimension 3 for Gamma_0(1) of weight 12 with sign 0 over Rational Field

sage: eps = DirichletGroup(13).0
sage: E = EisensteinForms(eps^2, 2)
sage: E.modular_symbols()
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 4 and level 13

sage: E = EisensteinForms(eps, 1); E
Eisenstein subspace of dimension 1 of Modular Forms space of dimension 1, character [zeta12]
sage: E.modular_symbols()
...
ValueError: the weight must be at least 2
```

class **EisensteinSubmodule_eps**(*ambient_space*)

Space of Eisenstein forms with given Dirichlet character.

EXAMPLES:

```
sage: e = DirichletGroup(27,CyclotomicField(3)).0**2
sage: M = ModularForms(e,2,prec=10).eisenstein_subspace()
sage: M.dimension()
6

sage: M.eisenstein_series()
```

```
[
-1/3*zeta6 - 1/3 + q + (2*zeta6 - 1)*q^2 + q^3 + (-2*zeta6 - 1)*q^4 + (-5*zeta6 + 1)*q^5 + O(q^6
-1/3*zeta6 - 1/3 + q^3 + O(q^6),
q + (-2*zeta6 + 1)*q^2 + (-2*zeta6 - 1)*q^4 + (5*zeta6 - 1)*q^5 + O(q^6),
q + (zeta6 + 1)*q^2 + 3*q^3 + (zeta6 + 2)*q^4 + (-zeta6 + 5)*q^5 + O(q^6),
q^3 + O(q^6),
q + (-zeta6 - 1)*q^2 + (zeta6 + 2)*q^4 + (zeta6 - 5)*q^5 + O(q^6)
]
sage: M.eisenstein_subspace().T(2).matrix().fcp()
(x + zeta3 + 2) * (x + 2*zeta3 + 1) * (x - 2*zeta3 - 1)^2 * (x - zeta3 - 2)^2
sage: ModularSymbols(e,2).eisenstein_subspace().T(2).matrix().fcp()
(x + zeta3 + 2) * (x + 2*zeta3 + 1) * (x - 2*zeta3 - 1)^2 * (x - zeta3 - 2)^2

sage: M.basis()
[
1 - 3*zeta3*q^6 + (-2*zeta3 + 2)*q^9 + O(q^10),
q + (5*zeta3 + 5)*q^7 + O(q^10),
q^2 - 2*zeta3*q^8 + O(q^10),
q^3 + (zeta3 + 2)*q^6 + 3*q^9 + O(q^10),
q^4 - 2*zeta3*q^7 + O(q^10),
q^5 + (zeta3 + 1)*q^8 + O(q^10)
]
```

class **EisensteinSubmodule_g0_Q**(*ambient_space*)
Space of Eisenstein forms for $\Gamma_0(N)$.

class **EisensteinSubmodule_g1_Q**(*ambient_space*)
Space of Eisenstein forms for $\Gamma_1(N)$.

class **EisensteinSubmodule_params**(*ambient_space*)

change_ring(*base_ring*)
Return self as a module over base_ring.
EXAMPLES:

```
sage: E = EisensteinForms(12,2) ; E
Eisenstein subspace of dimension 5 of Modular Forms space of dimension 5 for Congruence Subg
sage: E.basis()
[
1 + O(q^6),
q + 6*q^5 + O(q^6),
q^2 + O(q^6),
q^3 + O(q^6),
q^4 + O(q^6)
]
sage: E.change_ring(GF(5))
Eisenstein subspace of dimension 5 of Modular Forms space of dimension 5 for Congruence Subg
sage: E.change_ring(GF(5)).basis()
[
1 + O(q^6),
q + q^5 + O(q^6),
q^2 + O(q^6),
q^3 + O(q^6),
q^4 + O(q^6)
]
```

eisenstein_series()
Return the Eisenstein series that span this space (over the algebraic closure).

EXAMPLES:

```
sage: EisensteinForms(11,2).eisenstein_series()
[
5/12 + q + 3*q^2 + 4*q^3 + 7*q^4 + 6*q^5 + O(q^6)
]
sage: EisensteinForms(1,4).eisenstein_series()
[
1/240 + q + 9*q^2 + 28*q^3 + 73*q^4 + 126*q^5 + O(q^6)
]
sage: EisensteinForms(1,24).eisenstein_series()
[
236364091/131040 + q + 8388609*q^2 + 94143178828*q^3 + 70368752566273*q^4 + 1192092895507812
]
sage: EisensteinForms(5,4).eisenstein_series()
[
1/240 + q + 9*q^2 + 28*q^3 + 73*q^4 + 126*q^5 + O(q^6),
1/240 + q^5 + O(q^6)
]
sage: EisensteinForms(13,2).eisenstein_series()
[
1/2 + q + 3*q^2 + 4*q^3 + 7*q^4 + 6*q^5 + O(q^6)
]

sage: E = EisensteinForms(Gamma1(7),2)
sage: E.set_precision(4)
sage: E.eisenstein_series()
[
1/4 + q + 3*q^2 + 4*q^3 + O(q^4),
1/7*zeta6 - 3/7 + q + (-2*zeta6 + 1)*q^2 + (3*zeta6 - 2)*q^3 + O(q^4),
q + (-zeta6 + 2)*q^2 + (zeta6 + 2)*q^3 + O(q^4),
-1/7*zeta6 - 2/7 + q + (2*zeta6 - 1)*q^2 + (-3*zeta6 + 1)*q^3 + O(q^4),
q + (zeta6 + 1)*q^2 + (-zeta6 + 3)*q^3 + O(q^4)
]

sage: eps = DirichletGroup(13).0^2
sage: ModularForms(eps,2).eisenstein_series()
[
-7/13*zeta6 - 11/13 + q + (2*zeta6 + 1)*q^2 + (-3*zeta6 + 1)*q^3 + (6*zeta6 - 3)*q^4 - 4*q^5
q + (zeta6 + 2)*q^2 + (-zeta6 + 3)*q^3 + (3*zeta6 + 3)*q^4 + 4*q^5 + O(q^6)
]

sage: M = ModularForms(19,3).eisenstein_subspace()
sage: M.eisenstein_series()
[
]

sage: M = ModularForms(DirichletGroup(13).0, 1)
sage: M.eisenstein_series()
[
-1/13*zeta12^3 + 6/13*zeta12^2 + 4/13*zeta12 + 2/13 + q + (zeta12 + 1)*q^2 + zeta12^2*q^3 +
]
```

new_eisenstein_series()

Return a list of the Eisenstein series in this space that are new.

EXAMPLE:

```
sage: E = EisensteinForms(25, 4)
sage: E.new_eisenstein_series()
```

```
[q + 7*zeta4*q^2 - 26*zeta4*q^3 - 57*q^4 + O(q^6),
 q - 9*q^2 - 28*q^3 + 73*q^4 + O(q^6),
 q - 7*zeta4*q^2 + 26*zeta4*q^3 - 57*q^4 + O(q^6)]
```

new_submodule(*p=None*)

Return the new submodule of self.

EXAMPLE:

```
sage: e = EisensteinForms(Gamma0(225), 2).new_submodule(); e
Modular Forms subspace of dimension 3 of Modular Forms space of dimension 42 for Congruence
sage: e.basis()
[
q + O(q^6),
q^2 + O(q^6),
q^4 + O(q^6)
]
```

parameters()

Return a list of parameters for each Eisenstein series spanning self. That is, for each such series, return a triple of the form (ψ, χ, level), where ψ and χ are the characters defining the Eisenstein series, and level is the smallest level at which this series occurs.

EXAMPLES:

```
sage: ModularForms(24,2).eisenstein_submodule().parameters()
[([1, 1, 1], [1, 1, 1], 2),
([1, 1, 1], [1, 1, 1], 3),
([1, 1, 1], [1, 1, 1], 4),
([1, 1, 1], [1, 1, 1], 6),
([1, 1, 1], [1, 1, 1], 8),
([1, 1, 1], [1, 1, 1], 12),
([1, 1, 1], [1, 1, 1], 24)]
sage: EisensteinForms(12,6).parameters()
[([1, 1], [1, 1], 1),
([1, 1], [1, 1], 2),
([1, 1], [1, 1], 3),
([1, 1], [1, 1], 4),
([1, 1], [1, 1], 6),
([1, 1], [1, 1], 12)]
sage: ModularForms(DirichletGroup(24).0,3).eisenstein_submodule().parameters()
[([1, 1, 1], [-1, 1, 1], 1),
([1, 1, 1], [-1, 1, 1], 2),
([1, 1, 1], [-1, 1, 1], 3),
([1, 1, 1], [-1, 1, 1], 6),
([-1, 1, 1], [1, 1, 1], 1),
([-1, 1, 1], [1, 1, 1], 2),
([-1, 1, 1], [1, 1, 1], 3),
([-1, 1, 1], [1, 1, 1], 6)]
sage: EisensteinForms(DirichletGroup(24).0,1).parameters()
[([1, 1, 1], [-1, 1, 1], 1),
([1, 1, 1], [-1, 1, 1], 2),
([1, 1, 1], [-1, 1, 1], 3),
([1, 1, 1], [-1, 1, 1], 6)]
```

cyclotomic_restriction(*L, K*)

Given two cyclotomic fields L and K, compute the compositum M of K and L, and return a function and the index [M:K]. The function is a map that acts as follows (here $M = Q(\zeta_m)$):

INPUT:

element alpha in L

OUTPUT:

a polynomial $f(x)$ in $K[x]$ such that $f(\zeta_m) = \alpha$, where we view alpha as living in M. (Note that ζ_m generates M, not L.)

EXAMPLES:

```
sage: L = CyclotomicField(12) ; N = CyclotomicField(33) ; M = CyclotomicField(132)
sage: z, n = sage.modular.modform.eisenstein_submodule.cyclotomic_restriction(L,N)
sage: n
2

sage: z(L.0)
-zeta33^19*x
sage: z(L.0)(M.0)
zeta132^11

sage: z(L.0^3-L.0+1)
(zeta33^19 + zeta33^8)*x + 1
sage: z(L.0^3-L.0+1)(M.0)
zeta132^33 - zeta132^11 + 1
sage: z(L.0^3-L.0+1)(M.0) - M(L.0^3-L.0+1)
0
```

cyclotomic_restriction_tower(*L, K*)

Suppose L/K is an extension of cyclotomic fields and L=Q(zeta_m). This function computes a map with the following property:

INPUT:

an element alpha in L

OUTPUT:

a polynomial $f(x)$ in $K[x]$ such that $f(zeta_m) = alpha$.

EXAMPLES:

```
sage: L = CyclotomicField(12) ; K = CyclotomicField(6)
sage: z = sage.modular.modform.eisenstein_submodule.cyclotomic_restriction_tower(L,K)
sage: z(L.0)
x
sage: z(L.0^2+L.0)
x + zeta6
```

45.11 Eisenstein Series

compute_eisenstein_params(*character, k*)

Compute and return a list of all parameters (χ, ψ, t) that define the Eisenstein series with given character and weight k.

Only the parity of k is relevant (unless k = 1, which is a slightly different case).

If character is an integer N, then the parameters for $\Gamma_1(N)$ are computed instead. Then the condition is that $\chi(-1) * \psi(-1) = (-1)^k$.

EXAMPLES:

```
sage: sage.modular.modform.eis_series.compute_eisenstein_params(DirichletGroup(30)(1), 3)
[]
```

```
sage: sage.modular.modform.eis_series.compute_eisenstein_params(DirichletGroup(30)(1), 4)
[([1, 1], [1, 1], 1),
([1, 1], [1, 1], 2),
([1, 1], [1, 1], 3),
([1, 1], [1, 1], 5),
([1, 1], [1, 1], 6),
([1, 1], [1, 1], 10),
([1, 1], [1, 1], 15),
([1, 1], [1, 1], 30)]

sage: sage.modular.modform.eis_series.compute_eisenstein_params(15, 1)
[([1, 1], [-1, 1], 1),
 ([1, 1], [-1, 1], 5),
 ([1, 1], [1, zeta4], 1),
 ([1, 1], [1, zeta4], 3),
 ([1, 1], [-1, -1], 1),
 ([1, 1], [1, -zeta4], 1),
 ([1, 1], [1, -zeta4], 3),
 ([-1, 1], [1, -1], 1)]

sage: sage.modular.modform.eis_series.compute_eisenstein_params(DirichletGroup(15).0, 1)
[([1, 1], [-1, 1], 1), ([1, 1], [-1, 1], 5)]
```

eisenstein_series_lseries(*weight, prec=53, max_imaginary_part=0, max_asymp_coeffs=40*)

Return the L-series of the weight $2k$ Eisenstein series on $\mathrm{SL}_2(\mathbf{Z})$.

This actually returns an interface to Tim Dokchitser's program for computing with the L-series of the Eisenstein series

INPUT:

- `weight` - even integer
- `prec` - integer (bits precision)
- `max_imaginary_part` - real number
- `max_asymp_coeffs` - integer

OUTPUT:

The L-series of the Eisenstein series.

EXAMPLES:

We compute with the L-series of E_{16} and then E_{20}:

```
sage: L = eisenstein_series_lseries(16)
sage: L(1)
-0.291657724743873
sage: L = eisenstein_series_lseries(20)
sage: L(2)
-5.02355351645987
```

eisenstein_series_qexp(*k, prec=10, K=Rational Field, var='q'*)

Return the q-expansion of the normalized weight k Eisenstein series to precision prec in the ring K. (The normalization chosen here is the one that forces the coefficient of q to be 1.)

Here's a rough description of how the algorithm works: we know $E_k = const + \sum_n sigma(n, k-1)q^n$. Now, we basically just compute all the $\sigma(n, k-1)$ simultaneously, as σ is multiplicative.

INPUT:

- `k` - an even positive integer

- prec - (default: 10) a nonnegative integer
- K - (default: QQ) a ring in which -(2*k)/B_k is invertible
- var - (default: 'q') variable name to use for q-expansion

EXAMPLES:

```
sage: eisenstein_series_qexp(2,5)
-1/24 + q + 3*q^2 + 4*q^3 + 7*q^4 + O(q^5)
sage: eisenstein_series_qexp(2,0)
O(q^0)
sage: eisenstein_series_qexp(2,5,GF(7))
2 + q + 3*q^2 + 4*q^3 + O(q^5)
sage: eisenstein_series_qexp(2,5,GF(7),var='T')
2 + T + 3*T^2 + 4*T^3 + O(T^5)

sage: eisenstein_series_qexp(10, 30, GF(17))
15 + q + 3*q^2 + 15*q^3 + 7*q^4 + 13*q^5 + 11*q^6 + 11*q^7 + 15*q^8 + 7*q^9 + 5*q^10 + 7*q^11 +
```

AUTHORS:

- William Stein: original implementation

45.12 Elements of modular forms spaces.

class EisensteinSeries (*parent, vector, t, chi, psi*)

An Eisenstein series.

EXAMPLES:

```
sage: E = EisensteinForms(1,12)
sage: E.eisenstein_series()
[
691/65520 + q + 2049*q^2 + 177148*q^3 + 4196353*q^4 + 48828126*q^5 + O(q^6)
]
sage: E = EisensteinForms(11,2)
sage: E.eisenstein_series()
[
5/12 + q + 3*q^2 + 4*q^3 + 7*q^4 + 6*q^5 + O(q^6)
]
sage: E = EisensteinForms(Gamma1(7),2)
sage: E.set_precision(4)
sage: E.eisenstein_series()
[
1/4 + q + 3*q^2 + 4*q^3 + O(q^4),
1/7*zeta6 - 3/7 + q + (-2*zeta6 + 1)*q^2 + (3*zeta6 - 2)*q^3 + O(q^4),
q + (-zeta6 + 2)*q^2 + (zeta6 + 2)*q^3 + O(q^4),
-1/7*zeta6 - 2/7 + q + (2*zeta6 - 1)*q^2 + (-3*zeta6 + 1)*q^3 + O(q^4),
q + (zeta6 + 1)*q^2 + (-zeta6 + 3)*q^3 + O(q^4)
]
```

L()

Return the conductor of self.chi().

EXAMPLES:

```
sage: EisensteinForms(DirichletGroup(17).0,99).eisenstein_series()[1].L()
17
```

M()

Return the conductor of self.psi().

EXAMPLES:

```
sage: EisensteinForms(DirichletGroup(17).0,99).eisenstein_series()[1].M()
1
```

character()

Return the character associated to self.

EXAMPLES:

```
sage: EisensteinForms(DirichletGroup(17).0,99).eisenstein_series()[1].character()
[zeta16]

sage: chi = DirichletGroup(7)[4]
sage: E = EisensteinForms(chi).eisenstein_series() ; E
[
-1/7*zeta6 - 2/7 + q + (2*zeta6 - 1)*q^2 + (-3*zeta6 + 1)*q^3 + (-2*zeta6 - 1)*q^4 + (5*zeta
q + (zeta6 + 1)*q^2 + (-zeta6 + 3)*q^3 + (zeta6 + 2)*q^4 + (zeta6 + 4)*q^5 + O(q^6)
]
sage: E[0].character() == chi
True
sage: E[1].character() == chi
True
```

TESTS:

```
sage: [ [ f.character() == chi for f in EisensteinForms(chi).eisenstein_series() ] for chi i
[[True], [], [True, True], [], [True, True], [], [True, True], [], [True, True], [], [True,

sage: [ [ f.character() == chi for f in EisensteinForms(chi).eisenstein_series() ] for chi i
[[True, True, True, True, True], [], [True, True], [], [True, True, True, True], [], [True,
```

chi()

Return the parameter chi associated to self.

EXAMPLES:

```
sage: EisensteinForms(DirichletGroup(17).0,99).eisenstein_series()[1].chi()
[zeta16]
```

new_level()

Return level at which self is new.

EXAMPLES:

```
sage: EisensteinForms(DirichletGroup(17).0,99).eisenstein_series()[1].level()
17
sage: EisensteinForms(DirichletGroup(17).0,99).eisenstein_series()[1].new_level()
17
sage: [ [x.level(), x.new_level()] for x in EisensteinForms(DirichletGroup(60).0^2,2).eisens
[[60, 2], [60, 3], [60, 2], [60, 5], [60, 2], [60, 2], [60, 2], [60, 3], [60, 2], [60, 2], [
```

parameters()

Return chi, psi, and t, which are the defining parameters of self.

EXAMPLES:

```
sage: EisensteinForms(DirichletGroup(17).0,99).eisenstein_series()[1].parameters()
([zeta16], [1], 1)
```

psi()
Return the parameter psi associated to self.
EXAMPLES:

```
sage: EisensteinForms(DirichletGroup(17).0,99).eisenstein_series()[1].psi()
[1]
```

t()
Return the parameter t associated to self.
EXAMPLES:

```
sage: EisensteinForms(DirichletGroup(17).0,99).eisenstein_series()[1].t()
1
```

class **ModularFormElement**(*parent, x, check=True*)

atkin_lehner_eigenvalue(*d=None*)
Return the eigenvalue of the Atkin-Lehner operator W_d acting on this modular form (which is either 1 or -1), or None if this form is not an eigenvector for this operator.
EXAMPLE:

```
sage: CuspForms(1, 30).0.atkin_lehner_eigenvalue()
1
sage: CuspForms(2, 8).0.atkin_lehner_eigenvalue()
...
NotImplementedError: Don't know how to compute Atkin-Lehner matrix acting on this space (try
```

modform_lseries(*prec=53, max_imaginary_part=0, max_asymp_coeffs=40*)
Return the L-series of the weight k modular form f on $\mathrm{SL}_2(\mathbf{Z})$.
This actually returns an interface to Tim Dokchitser's program for computing with the L-series of the modular form.
INPUT:

- `prec` - integer (bits precision)
- `max_imaginary_part` - real number
- `max_asymp_coeffs` - integer

OUTPUT:
The L-series of the modular form.
EXAMPLES:
We compute with the L-series of the Eisenstein series E_4:

```
sage: f = ModularForms(1,4).0
sage: L = f.modform_lseries()
sage: L(1)
-0.0304484570583933
```

class **ModularFormElement_elliptic_curve**(*parent, E*)
A modular form attached to an elliptic curve.

atkin_lehner_eigenvalue(*d=None*)
Calculate the eigenvalue of the Atkin-Lehner operator W_d acting on this form. If d is None, default to the level of the form. As this form is attached to an elliptic curve, we can read this off from the root number of the curve if d is the level.
EXAMPLE:

```
sage: EllipticCurve('57a1').newform().atkin_lehner_eigenvalue()
1
```

```
sage: EllipticCurve('57b1').newform().atkin_lehner_eigenvalue()
-1
sage: EllipticCurve('57b1').newform().atkin_lehner_eigenvalue(19)
1
```

elliptic_curve()

Return elliptic curve associated to self.

EXAMPLES:

```
sage: E = EllipticCurve('11a')
sage: f = E.modular_form()
sage: f.elliptic_curve()
Elliptic Curve defined by y^2 + y = x^3 - x^2 - 10*x - 20 over Rational Field
sage: f.elliptic_curve() is E
True
```

class **ModularForm_abstract**()

Constructor for generic class of a modular form. This should never be called directly; instead one should instantiate one of the derived classes of this class.

atkin_lehner_eigenvalue(*d=None*)

Return the eigenvalue of the Atkin-Lehner operator W_d acting on self (which is either 1 or -1), or None if this form is not an eigenvector for this operator. If d is not given or is None, use d = the level.

EXAMPLES:

```
sage: sage.modular.modform.element.ModularForm_abstract.atkin_lehner_eigenvalue(CuspForms(2,
...
NotImplementedError
```

base_ring()

Return the base_ring of self.

EXAMPLES:

```
sage: (ModularForms(117, 2).13).base_ring()
Rational Field
sage: (ModularForms(119, 2, base_ring=GF(7)).12).base_ring()
Finite Field of size 7
```

character()

Return the character of self.

EXAMPLES:

```
sage: ModularForms(DirichletGroup(17).0^2,2).2.character()
[zeta8]
```

coefficients(*X*)

The coefficients a_n of self, for integers n>=0 in the list X. If X is an Integer, return coefficients for indices from 1 to X.

This function caches the results of the compute function.

TESTS:

```
sage: e = DirichletGroup(11).gen()
sage: f = EisensteinForms(e, 3).eisenstein_series()[0]
sage: f.coefficients([0,1])
[15/11*zeta10^3 - 9/11*zeta10^2 - 26/11*zeta10 - 10/11,
1]
sage: f.coefficients([0,1,2,3])
[15/11*zeta10^3 - 9/11*zeta10^2 - 26/11*zeta10 - 10/11,
1,
```

```
4*zeta10 + 1,
-9*zeta10^3 + 1]
sage: f.coefficients([2,3])
[4*zeta10 + 1,
-9*zeta10^3 + 1]
```

Running this twice once revealed a bug, so we test it:

```
sage: f.coefficients([0,1,2,3])
[15/11*zeta10^3 - 9/11*zeta10^2 - 26/11*zeta10 - 10/11,
1,
4*zeta10 + 1,
-9*zeta10^3 + 1]
```

cuspform_lseries (*prec=53, max_imaginary_part=0, max_asymp_coeffs=40*)

Return the L-series of the weight k cusp form f on $\Gamma_0(N)$.

This actually returns an interface to Tim Dokchitser's program for computing with the L-series of the cusp form.

INPUT:

- `prec` - integer (bits precision)
- `max_imaginary_part` - real number
- `max_asymp_coeffs` - integer

OUTPUT:

The L-series of the cusp form.

EXAMPLES:

```
sage: f = CuspForms(2,8).newforms()[0]
sage: L = f.cuspform_lseries()
sage: L(1)
0.0884317737041015
sage: L(0.5)
0.0296568512531983
```

Consistency check with delta_lseries (which computes coefficients in pari):

```
sage: delta = CuspForms(1,12).0
sage: L = delta.cuspform_lseries()
sage: L(1)
0.0374412812685155
sage: L = delta_lseries()
sage: L(1)
0.0374412812685155
```

We check that #5262 is fixed:

```
sage: E=EllipticCurve('37b2')
sage: h=Newforms(37)[1]
sage: Lh = h.cuspform_lseries()
sage: LE=E.lseries()
sage: Lh(1), LE(1)
(0.725681061936153, 0.725681061936153)
sage: CuspForms(1, 30).0.cuspform_lseries().eps
-1
```

group()

Return the group for which self is a modular form.

EXAMPLES:

```
sage: ModularForms(Gamma1(11), 2).gen(0).group()
Congruence Subgroup Gamma1(11)
```

level()

Return the level of self.

EXAMPLES:

```
sage: ModularForms(25,4).0.level()
25
```

padded_list(*n*)

Return a list of length n whose entries are the first n coefficients of the q-expansion of self.

EXAMPLES:

```
sage: CuspForms(1,12).0.padded_list(20)
[0, 1, -24, 252, -1472, 4830, -6048, -16744, 84480, -113643, -115920, 534612, -370944, -5777
```

prec()

Return the precision to which self.q_expansion() is currently known. Note that this may be 0.

EXAMPLES:

```
sage: M = ModularForms(2,14)
sage: f = M.0
sage: f.prec()
0

sage: M.prec(20)
20
sage: f.prec()
0
sage: x = f.q_expansion() ; f.prec()
20
```

q_expansion(*prec=None*)

The q-expansion of the modular form to precision $O(q^{\text{prec}})$. This function takes one argument, which is the integer prec.

EXAMPLES:

We compute the cusp form Δ:

```
sage: delta = CuspForms(1,12).0
sage: delta.q_expansion()
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 + O(q^6)
```

We compute the q-expansion of one of the cusp forms of level 23:

```
sage: f = CuspForms(23,2).0
sage: f.q_expansion()
q - q^3 - q^4 + O(q^6)
sage: f.q_expansion(10)
q - q^3 - q^4 - 2*q^6 + 2*q^7 - q^8 + 2*q^9 + O(q^10)
sage: f.q_expansion(2)
q + O(q^2)
sage: f.q_expansion(1)
O(q^1)
sage: f.q_expansion(0)
O(q^0)
```

qexp(*prec=None*)

Same as self.q_expansion(prec).

EXAMPLES:

```
sage: CuspForms(1,12).0.qexp()
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 + O(q^6)
```

valuation()

Return the valuation of self (i.e. as an element of the power series ring in q).

EXAMPLES:

```
sage: ModularForms(11,2).0.valuation()
1
sage: ModularForms(11,2).1.valuation()
0
sage: ModularForms(25,6).1.valuation()
2
sage: ModularForms(25,6).6.valuation()
7
```

weight()

Return the weight of self.

EXAMPLES:

```
sage: (ModularForms(Gamma1(9),2).6).weight()
2
```

class **Newform**(*parent, component, names, check=True*)

abelian_variety()

Return the abelian variety associated to self.

EXAMPLES:

```
sage: Newforms(14,2)[0]
q - q^2 - 2*q^3 + q^4 + O(q^6)
sage: Newforms(14,2)[0].abelian_variety()
Newform abelian subvariety 14a of dimension 1 of J0(14)
```

atkin_lehner_eigenvalue(*d=None*)

Return the eigenvalue of the Atkin-Lehner operator W_d acting on this newform (which is either 1 or -1). A ValueError will be raised if the character of this form is not either trivial or quadratic. If d is not given or is None, then d defaults to the level of self.

EXAMPLE:

```
sage: [x.atkin_lehner_eigenvalue() for x in ModularForms(53).newforms('a')]
[1, -1]
sage: CuspForms(DirichletGroup(5).0, 5).newforms()[0].atkin_lehner_eigenvalue()
...
ValueError: Atkin-Lehner only leaves space invariant when character is trivial or quadratic.
```

element()

Find an element of the ambient space of modular forms which represents this newform.

Note: This can be quite expensive. Also, the polynomial defining the field of Hecke eigenvalues should be considered random, since it is generated by a random sum of Hecke operators. (The field itself is not random, of course.)

EXAMPLES:

```
sage: ls = Newforms(38,4,names='a')
sage: ls[0]
q - 2*q^2 - 2*q^3 + 4*q^4 - 9*q^5 + O(q^6)
sage: ls # random
[q - 2*q^2 - 2*q^3 + 4*q^4 - 9*q^5 + O(q^6),
```

```
q - 2*q^2 + (-a1 - 2)*q^3 + 4*q^4 + (2*a1 + 10)*q^5 + O(q^6),
q + 2*q^2 + (1/2*a2 - 1)*q^3 + 4*q^4 + (-3/2*a2 + 12)*q^5 + O(q^6)]
sage: type(ls[0])
<class 'sage.modular.modform.element.Newform'>
sage: ls[2][3].minpoly()
x^2 - 9*x + 2
sage: ls2 = [ x.element() for x in ls ]
sage: ls2 # random
[q - 2*q^2 - 2*q^3 + 4*q^4 - 9*q^5 + O(q^6),
q - 2*q^2 + (-a1 - 2)*q^3 + 4*q^4 + (2*a1 + 10)*q^5 + O(q^6),
q + 2*q^2 + (1/2*a2 - 1)*q^3 + 4*q^4 + (-3/2*a2 + 12)*q^5 + O(q^6)]
sage: type(ls2[0])
<class 'sage.modular.modform.element.ModularFormElement'>
sage: ls2[2][3].minpoly()
x^2 - 9*x + 2
```

hecke_eigenvalue_field()

Return the field generated over the rationals by the coefficients of this newform.

EXAMPLES:

```
sage: ls = Newforms(35, 2, names='a') ; ls
[q + q^3 - 2*q^4 - q^5 + O(q^6),
q + a1*q^2 + (-a1 - 1)*q^3 + (-a1 + 2)*q^4 + q^5 + O(q^6)]
sage: ls[0].hecke_eigenvalue_field()
Rational Field
sage: ls[1].hecke_eigenvalue_field()
Number Field in a1 with defining polynomial x^2 + x - 4
```

modular_symbols(*sign=0*)

Return the subspace with the specified sign of the space of modular symbols corresponding to this newform.

EXAMPLES:

```
sage: f = Newforms(18,4)[0]
sage: f.modular_symbols()
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 18 for Gamma_0
sage: f.modular_symbols(1)
Modular Symbols subspace of dimension 1 of Modular Symbols space of dimension 11 for Gamma_0
```

number()

Return the index of this space in the list of simple, new, cuspidal subspaces of the full space of modular symbols for this weight and level.

EXAMPLES:

```
sage: Newforms(43, 2, names='a')[1].number()
1
```

delta_lseries(*prec=53, max_imaginary_part=0, max_asymp_coeffs=40*)

Return the L-series of the modular form Delta.

This actually returns an interface to Tim Dokchitser's program for computing with the L-series of the modular form Δ.

INPUT:

- `prec` - integer (bits precision)
- `max_imaginary_part` - real number
- `max_asymp_coeffs` - integer

OUTPUT:

The L-series of Δ.

EXAMPLES:

```
sage: L = delta_lseries()
sage: L(1)
0.0374412812685155
```

is_ModularFormElement(*x*)

Return True if x is a modular form.

EXAMPLES:

```
sage: from sage.modular.modform.element import is_ModularFormElement
sage: is_ModularFormElement(5)
False
sage: is_ModularFormElement(ModularForms(11).0)
True
```

45.13 Hecke Operators on q-expansions.

hecke_operator_on_basis(*B, n, k, eps=None, already_echelonized=False*)

Given a basis B of q-expansions for a space of modular forms with character ε to precision at least $\#B \cdot n + 1$, this function computes the matrix of T_n relative to B.

Note: If the elements of B are not known to sufficient precision, this function will report that the vectors are linearly dependent (since they are to the specified precision).

INPUT:

- `B` - list of q-expansions
- `n` - an integer >= 1
- `k` - an integer
- `eps` - Dirichlet character
- `already_echelonized` – bool (default: False); if True, use that the basis is already in Echelon form, which saves a lot of time.

EXAMPLES:

```
sage: sage.modular.modform.constructor.ModularForms_clear_cache()
sage: ModularForms(1,12).q_expansion_basis()
[
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 + O(q^6),
1 + 65520/691*q + 134250480/691*q^2 + 11606736960/691*q^3 + 274945048560/691*q^4 + 3199218815520
]
sage: hecke_operator_on_basis(ModularForms(1,12).q_expansion_basis(), 3, 12)
...
ValueError: The given basis vectors must be linearly independent.

sage: hecke_operator_on_basis(ModularForms(1,12).q_expansion_basis(30), 3, 12)
[   252      0]
[     0 177148]
```

hecke_operator_on_qexp (*f, n, k, eps=None, prec=None, check=True, _return_list=False*)

Given the q-expansion f of a modular form with character ε, this function computes the image of f under the Hecke operator $T_{n,k}$ of weight k.

EXAMPLES:

```
sage: M = ModularForms(1,12)
sage: hecke_operator_on_qexp(M.basis()[0], 3, 12)
252*q - 6048*q^2 + 63504*q^3 - 370944*q^4 + O(q^5)
sage: hecke_operator_on_qexp(M.basis()[0], 1, 12, prec=7)
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 - 6048*q^6 + O(q^7)
sage: hecke_operator_on_qexp(M.basis()[0], 1, 12)
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 - 6048*q^6 - 16744*q^7 + 84480*q^8 - 113643*q^9 - 115

sage: M.prec(20)
20
sage: hecke_operator_on_qexp(M.basis()[0], 3, 12)
252*q - 6048*q^2 + 63504*q^3 - 370944*q^4 + 1217160*q^5 - 1524096*q^6 + O(q^7)
sage: hecke_operator_on_qexp(M.basis()[0], 1, 12)
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 - 6048*q^6 - 16744*q^7 + 84480*q^8 - 113643*q^9 - 115

sage: (hecke_operator_on_qexp(M.basis()[0], 1, 12)*252).add_bigoh(7)
252*q - 6048*q^2 + 63504*q^3 - 370944*q^4 + 1217160*q^5 - 1524096*q^6 + O(q^7)

sage: hecke_operator_on_qexp(M.basis()[0], 6, 12)
-6048*q + 145152*q^2 - 1524096*q^3 + O(q^4)
```

An example on a formal power series:

```
sage: R.<q> = QQ[[]]
sage: f = q + q^2 + q^3 + q^7 + O(q^8)
sage: hecke_operator_on_qexp(f, 3, 12)
q + O(q^3)
sage: hecke_operator_on_qexp(delta_qexp(24), 3, 12).prec()
8
sage: hecke_operator_on_qexp(delta_qexp(25), 3, 12).prec()
9
```

45.14 Numerical computation of newforms

class NumericalEigenforms (*group, weight=2, eps=9.9999999999999995e-21, delta=0.01, tp=, [2, 3, 5]*)

numerical_eigenforms(group, weight=2, eps=1e-20, delta=1e-2, tp=[2,3,5])

INPUT:

- `group` - a congruence subgroup of a Dirichlet character of order 1 or 2
- `weight` - an integer >= 2
- `eps` - a small float; abs( ) < eps is what "equal to zero" is interpreted as for floating point numbers.
- `delta` - a small-ish float; eigenvalues are considered distinct if their difference has absolute value at least delta
- `tp` - use the Hecke operators T_p for p in tp when searching for a random Hecke operator with distinct Hecke eigenvalues.

OUTPUT:

A numerical eigenforms object, with the following useful methods:

- ap() - return all eigenvalues of T_p
- eigenvalues() - list of eigenvalues corresponding to the given list of primes, e.g.,:

```
[[eigenvalues of T_2],
 [eigenvalues of T_3],
 [eigenvalues of T_5], ...]
```

- systems_of_eigenvalues() - a list of the systems of eigenvalues of eigenforms such that the chosen random linear combination of Hecke operators has multiplicity 1 eigenvalues.

EXAMPLES:

```
sage: n = numerical_eigenforms(23)
sage: n == loads(dumps(n))
True
sage: n.ap(2)
[3.0, 0.61803398875, -1.61803398875]
sage: n.systems_of_eigenvalues(7)
[
[-1.61803398875, 2.2360679775, -3.2360679775],
[0.61803398875, -2.2360679775, 1.2360679775],
[3.0, 4.0, 6.0]
]
sage: n.systems_of_abs(7)
[
[0.6180339887..., 2.236067977..., 1.236067977...],
[1.6180339887..., 2.236067977..., 3.236067977...],
[3.0, 4.0, 6.0]
]
sage: n.eigenvalues([2,3,5])
[[3.0, 0.61803398875, -1.61803398875],
 [4.0, -2.2360679775, 2.2360679775],
 [6.0, 1.2360679775, -3.2360679775]]
```

ap(*p*)

Return a list of the eigenvalues of the Hecke operator T_p on all the computed eigenforms. The eigenvalues match up between one prime and the next.

INPUT:

- p - integer, a prime number

OUTPUT:

- list - a list of double precision complex numbers

EXAMPLES:

```
sage: n = numerical_eigenforms(11,4)
sage: n.ap(2) # random order
[9.0, 9.0, 2.73205080757, -0.732050807569]
sage: n.ap(3) # random order
[28.0, 28.0, -7.92820323028, 5.92820323028]
sage: m = n.modular_symbols()
sage: x = polygen(QQ, 'x')
sage: m.T(2).charpoly(x).factor()
(x - 9)^2 * (x^2 - 2*x - 2)
sage: m.T(3).charpoly(x).factor()
(x - 28)^2 * (x^2 + 2*x - 47)
```

eigenvalues(*primes*)

Return the eigenvalues of the Hecke operators corresponding to the primes in the input list of primes. The eigenvalues match up between one prime and the next.

INPUT:

- `primes` - a list of primes

OUTPUT:

list of lists of eigenvalues.

EXAMPLES:

```
sage: n = numerical_eigenforms(1,12)
sage: n.eigenvalues([3,5,13])
[[177148.0, 252.0], [48828126.0, 4830.0], [1.79216039404e+12, -577737.999...]]
```

level()

Return the level of this set of modular eigenforms.

EXAMPLES:

```
sage: n = numerical_eigenforms(61) ; n.level()
61
```

modular_symbols()

Return the space of modular symbols used for computing this set of modular eigenforms.

EXAMPLES:

```
sage: n = numerical_eigenforms(61) ; n.modular_symbols()
Modular Symbols space of dimension 5 for Gamma_0(61) of weight 2 with sign 1 over Rational F
```

systems_of_abs(*bound*)

Return the absolute values of all systems of eigenvalues for self for primes up to bound.

EXAMPLES:

```
sage: numerical_eigenforms(61).systems_of_abs(10)
[
[0.311107817466, 2.90321192591, 2.52542756084, 3.21431974338],
[1.0, 2.0, 3.0, 1.0],
[1.48119430409, 0.806063433525, 3.15632517466, 0.675130870567],
[2.17008648663, 1.70927535944, 1.63089761382, 0.460811127189],
[3.0, 4.0, 6.0, 8.0]
]
```

systems_of_eigenvalues(*bound*)

Return all systems of eigenvalues for self for primes up to bound.

EXAMPLES:

```
sage: numerical_eigenforms(61).systems_of_eigenvalues(10)
[
[-1.48119430409..., 0.806063433525..., 3.15632517466..., 0.675130870567...],
[-1.0..., -2.0..., -3.0..., 1.0...],
[0.311107817466..., 2.90321192591..., -2.52542756084..., -3.21431974338...],
[2.17008648663..., -1.70927535944..., -1.63089761382..., -0.460811127189...],
[3.0, 4.0, 6.0, 8.0]
]
```

weight()

Return the weight of this set of modular eigenforms.

EXAMPLES:

```
sage: n = numerical_eigenforms(61) ; n.weight()
2
```

support(*v*, *eps*)

Given a vector v and a threshold eps, return all indices where $|v|$ is larger than eps.

EXAMPLES:

```
sage: sage.modular.modform.numerical.support( numerical_eigenforms(61)._easy_vector(), 1.0 )
[]

sage: sage.modular.modform.numerical.support( numerical_eigenforms(61)._easy_vector(), 0.5 )
[0, 1]
```

45.15 The Victor Miller Basis

delta_qexp (*prec=10, var='q', K=Integer Ring*)

Return the q-expansion of Delta as a power series with coefficients in K (=ZZ by default).

INPUT:

- `prec` – integer; the absolute precision of the output
- `var` – (default: 'q') variable name
- `K` – (default: ZZ) base ring of answer

OUTPUT: a power series over K

ALGORITHM: Compute a simple very explicit modular form whose 8th power is Delta. Then compute the 8th power using NTL polynomial arithmetic, which is VERY fast. This function computes a *million* terms of Delta in under a minute.

EXAMPLES:

```
sage: delta_qexp(7)
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 - 6048*q^6 + O(q^7)
sage: delta_qexp(7,'z')
z - 24*z^2 + 252*z^3 - 1472*z^4 + 4830*z^5 - 6048*z^6 + O(z^7)
sage: delta_qexp(-3)
...
ValueError: prec must be positive
```

AUTHORS:

- William Stein: original code
- David Harvey (2007-05): sped up first squaring step

victor_miller_basis (*k, prec=10, cusp_only=False, var='q'*)

Compute and return the Victor-Miller basis for modular forms of weight k and level 1 to precision $O(q^{prec})$. If `cusp_only` is True, return only a basis for the cuspidal subspace.

INPUT:

- `k` – an integer
- `prec` – (default: 10) a positive integer
- `cusp_only` – bool (default: False)
- `var` – string (default: 'q'

OUTPUT: A sequence whose entries are power series in ZZ[[var]].

EXAMPLES:

```
sage: victor_miller_basis(1, 6)
[]
sage: victor_miller_basis(0, 6)
[
1 + O(q^6)
]
sage: victor_miller_basis(2, 6)
[]
sage: victor_miller_basis(4, 6)
[
1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + O(q^6)
]

sage: victor_miller_basis(6, 6, var='w')
[
1 - 504*w - 16632*w^2 - 122976*w^3 - 532728*w^4 - 1575504*w^5 + O(w^6)
]

sage: victor_miller_basis(6, 6)
[
1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + O(q^6)
]
sage: victor_miller_basis(12, 6)
[
1 + 196560*q^2 + 16773120*q^3 + 398034000*q^4 + 4629381120*q^5 + O(q^6),
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 + O(q^6)
]

sage: victor_miller_basis(12, 6, cusp_only=True)
[
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 + O(q^6)
]
sage: victor_miller_basis(24, 6, cusp_only=True)
[
q + 195660*q^3 + 12080128*q^4 + 44656110*q^5 + O(q^6),
q^2 - 48*q^3 + 1080*q^4 - 15040*q^5 + O(q^6)
]
sage: victor_miller_basis(24, 6)
[
1 + 52416000*q^3 + 39007332000*q^4 + 6609020221440*q^5 + O(q^6),
q + 195660*q^3 + 12080128*q^4 + 44656110*q^5 + O(q^6),
q^2 - 48*q^3 + 1080*q^4 - 15040*q^5 + O(q^6)
]
sage: victor_miller_basis(32, 6)
[
1 + 2611200*q^3 + 19524758400*q^4 + 19715347537920*q^5 + O(q^6),
q + 50220*q^3 + 87866368*q^4 + 18647219790*q^5 + O(q^6),
q^2 + 432*q^3 + 39960*q^4 - 1418560*q^5 + O(q^6)
]

sage: victor_miller_basis(40,200)[1:] == victor_miller_basis(40,200,cusp_only=True)
True
sage: victor_miller_basis(200,40)[1:] == victor_miller_basis(200,40,cusp_only=True)
True
```

45.16 Ambient Spaces of Modular Forms.

EXAMPLES:

We compute a basis for the ambient space $M_2(\Gamma_1(25), \chi)$, where χ is quadratic.

```
sage: chi = DirichletGroup(25,QQ).0; chi
[-1]
sage: n = ModularForms(chi,2); n
Modular Forms space of dimension 6, character [-1] and weight 2 over Rational Field
sage: type(n)
<class 'sage.modular.modform.ambient_eps.ModularFormsAmbient_eps'>
```

Compute a basis:

```
sage: n.basis()
[
1 + O(q^6),
q + O(q^6),
q^2 + O(q^6),
q^3 + O(q^6),
q^4 + O(q^6),
q^5 + O(q^6)
]
```

Compute the same basis but to higher precision:

```
sage: n.set_precision(20)
sage: n.basis()
[
1 + 10*q^10 + 20*q^15 + O(q^20),
q + 5*q^6 + q^9 + 12*q^11 - 3*q^14 + 17*q^16 + 8*q^19 + O(q^20),
q^2 + 4*q^7 - q^8 + 8*q^12 + 2*q^13 + 10*q^17 - 5*q^18 + O(q^20),
q^3 + q^7 + 3*q^8 - q^12 + 5*q^13 + 3*q^17 + 6*q^18 + O(q^20),
q^4 - q^6 + 2*q^9 + 3*q^14 - 2*q^16 + 4*q^19 + O(q^20),
q^5 + q^10 + 2*q^15 + O(q^20)
]
```

TESTS:

```
sage: m = ModularForms(Gamma1(20),2,GF(7))
sage: loads(dumps(m)) == m
True
```

```
sage: m = ModularForms(GammaH(11,[2]), 2); m
Modular Forms space of dimension 2 for Congruence Subgroup Gamma_H(11) with H generated by [2] of wei
sage: type(m)
<class 'sage.modular.modform.ambient.ModularFormsAmbient'>
```

class **ModularFormsAmbient**(*group, weight, base_ring, character=None*)

An ambient space of modular forms.

ambient_space()

Return the ambient space that contains this ambient space. This is, of course, just this space again.

EXAMPLES:

```
sage: m = ModularForms(Gamma0(3),30)
sage: m.ambient_space() is m
True
```

change_ring(*base_ring*)

Change the base ring of this space of modular forms.

INPUT:

- R - ring

EXAMPLES:

```
sage: M = ModularForms(Gamma0(37),2)
sage: M.basis()
[
q + q^3 - 2*q^4 + O(q^6),
q^2 + 2*q^3 - 2*q^4 + q^5 + O(q^6),
1 + 2/3*q + 2*q^2 + 8/3*q^3 + 14/3*q^4 + 4*q^5 + O(q^6)
]
```

The basis after changing the base ring is the reduction modulo 3 of an integral basis.

```
sage: M3 = M.change_ring(GF(3))
sage: M3.basis()
[
1 + q^3 + q^4 + 2*q^5 + O(q^6),
q + q^3 + q^4 + O(q^6),
q^2 + 2*q^3 + q^4 + q^5 + O(q^6)
]
```

cuspidal_submodule()

Return the cuspidal submodule of this ambient module.

EXAMPLES:

```
sage: ModularForms(Gamma1(13)).cuspidal_submodule()
Cuspidal subspace of dimension 2 of Modular Forms space of dimension 13 for
Congruence Subgroup Gamma1(13) of weight 2 over Rational Field
```

dimension()

Return the dimension of this ambient space of modular forms, computed using a dimension formula (so it should be reasonably fast).

EXAMPLES:

```
sage: m = ModularForms(Gamma1(20),20)
sage: m.dimension()
238
```

eisenstein_params()

Return parameters that define all Eisenstein series in self.

OUTPUT: an immutable Sequence

EXAMPLES:

```
sage: m = ModularForms(Gamma0(22), 2)
sage: v = m.eisenstein_params(); v
[([1], [1], 2), ([1], [1], 11), ([1], [1], 22)]
sage: type(v)
<class 'sage.structure.sequence.Sequence'>
```

eisenstein_series()

Return all Eisenstein series associated to this space.

```
sage: ModularForms(27,2).eisenstein_series()
[
q^3 + O(q^6),
q - 3*q^2 + 7*q^4 - 6*q^5 + O(q^6),
1/12 + q + 3*q^2 + q^3 + 7*q^4 + 6*q^5 + O(q^6),
1/3 + q + 3*q^2 + 4*q^3 + 7*q^4 + 6*q^5 + O(q^6),
13/12 + q + 3*q^2 + 4*q^3 + 7*q^4 + 6*q^5 + O(q^6)
]

sage: ModularForms(Gamma1(5),3).eisenstein_series()
[
-1/5*zeta4 - 2/5 + q + (4*zeta4 + 1)*q^2 + (-9*zeta4 + 1)*q^3 + (4*zeta4 - 15)*q^4 + q^5 + O
q + (zeta4 + 4)*q^2 + (-zeta4 + 9)*q^3 + (4*zeta4 + 15)*q^4 + 25*q^5 + O(q^6),
1/5*zeta4 - 2/5 + q + (-4*zeta4 + 1)*q^2 + (9*zeta4 + 1)*q^3 + (-4*zeta4 - 15)*q^4 + q^5 + O
q + (-zeta4 + 4)*q^2 + (zeta4 + 9)*q^3 + (-4*zeta4 + 15)*q^4 + 25*q^5 + O(q^6)
]

sage: eps = DirichletGroup(13).0^2
sage: ModularForms(eps,2).eisenstein_series()
[
-7/13*zeta6 - 11/13 + q + (2*zeta6 + 1)*q^2 + (-3*zeta6 + 1)*q^3 + (6*zeta6 - 3)*q^4 - 4*q^5
q + (zeta6 + 2)*q^2 + (-zeta6 + 3)*q^3 + (3*zeta6 + 3)*q^4 + 4*q^5 + O(q^6)
]
```

eisenstein_submodule()

Return the Eisenstein submodule of this ambient module.

EXAMPLES:

```
sage: m = ModularForms(Gamma1(13),2); m
Modular Forms space of dimension 13 for Congruence Subgroup Gamma1(13) of weight 2 over Rati
sage: m.eisenstein_submodule()
Eisenstein subspace of dimension 11 of Modular Forms space of dimension 13 for Congruence Su
```

free_module()

hecke_module_of_level(*N*)

Return the Hecke module of level N corresponding to self, which is the domain or codomain of a degeneracy map from self. Here N must be either a divisor or a multiple of the level of self.

EXAMPLES:

```
sage: ModularForms(25, 6).hecke_module_of_level(5)
Modular Forms space of dimension 3 for Congruence Subgroup Gamma0(5) of weight 6 over Ration
sage: ModularForms(Gamma1(4), 3).hecke_module_of_level(8)
Modular Forms space of dimension 7 for Congruence Subgroup Gamma1(8) of weight 3 over Ration
sage: ModularForms(Gamma1(4), 3).hecke_module_of_level(9)
...
ValueError: N (=9) must be a divisor or a multiple of the level of self (=4)
```

is_ambient()

Return True if this an ambient space of modular forms.

This is an ambient space, so this function always returns True.

EXAMPLES:

```
sage: ModularForms(11).is_ambient()
True
sage: CuspForms(11).is_ambient()
False
```

modular_symbols(*sign=0*)

Return the corresponding space of modular symbols with the given sign.

EXAMPLES:

```
sage: S = ModularForms(11,2)
sage: S.modular_symbols()
Modular Symbols space of dimension 3 for Gamma_0(11) of weight 2 with sign 0 over Rational F
sage: S.modular_symbols(sign=1)
Modular Symbols space of dimension 2 for Gamma_0(11) of weight 2 with sign 1 over Rational F
sage: S.modular_symbols(sign=-1)
Modular Symbols space of dimension 1 for Gamma_0(11) of weight 2 with sign -1 over Rational

sage: ModularForms(1,12).modular_symbols()
Modular Symbols space of dimension 3 for Gamma_0(1) of weight 12 with sign 0 over Rational F
```

module()

Return the underlying free module corresponding to this space of modular forms.

If the dimension of self can be computed reasonably quickly, then this function returns a free module (viewed as a tuple space) of the same dimension as self over the same base ring. Otherwise, the dimension of self.module() may be smaller. For example, in the case of weight 1 forms, in some cases the dimension can't easily be computed so self.module() is of smaller dimension.

EXAMPLES:

```
sage: m = ModularForms(Gamma1(13),10)
sage: m.free_module()
Vector space of dimension 69 over Rational Field
sage: ModularForms(Gamma1(13),4, GF(49,'b')).free_module()
Vector space of dimension 27 over Finite Field in b of size 7^2
```

Note that in the following example the dimension can't be (quickly) computed, so M.module() returns a space of different dimension than M:

```
sage: M = ModularForms(Gamma1(57), 1); M
Modular Forms space of dimension (unknown) for Congruence ...
sage: M.module()
Vector space of dimension 36 over Rational Field
sage: M.basis()
...
NotImplementedError: Computation of dimensions of weight 1 cusp forms spaces not implemented
```

new_submodule(*p=None*)

Return the new or p-new submodule of this ambient module.

INPUT:

- p - (default: None), if specified return only the p-new submodule.

EXAMPLES:

```
sage: m = ModularForms(Gamma0(33),2); m
Modular Forms space of dimension 6 for Congruence Subgroup Gamma0(33) of weight 2 over Ratio
sage: m.new_submodule()
Modular Forms subspace of dimension 1 of Modular Forms space of dimension 6 for Congruence S
```

Another example:

```
sage: M = ModularForms(17,4)
sage: N = M.new_subspace(); N
Modular Forms subspace of dimension 4 of Modular Forms space of dimension 6 for Congruence S
sage: N.basis()
[
q + 2*q^5 + O(q^6),
q^2 - 3/2*q^5 + O(q^6),
q^3 + O(q^6),
```

```
q^4 - 1/2*q^5 + O(q^6)
]

sage: ModularForms(12,4).new_submodule()
Modular Forms subspace of dimension 1 of Modular Forms space of dimension 9 for Congruence S
```

Unfortunately (TODO) - p-new submodules aren't yet implemented:

```
sage: m.new_submodule(3)            # not implemented
...
NotImplementedError
sage: m.new_submodule(11)           # not implemented
...
NotImplementedError
```

prec(*new_prec=None*)

Set or get default initial precision for printing modular forms.

INPUT:

- `new_prec` - positive integer (default: None)

OUTPUT: if new_prec is None, returns the current precision.

EXAMPLES:

```
sage: M = ModularForms(1,12, prec=3)
sage: M.prec()
3

sage: M.basis()
[
q - 24*q^2 + O(q^3),
1 + 65520/691*q + 134250480/691*q^2 + O(q^3)
]

sage: M.prec(5)
5
sage: M.basis()
[
q - 24*q^2 + 252*q^3 - 1472*q^4 + O(q^5),
1 + 65520/691*q + 134250480/691*q^2 + 11606736960/691*q^3 + 274945048560/691*q^4 + O(q^5)
]
```

rank()

This is a synonym for `self.dimension()`.

EXAMPLES:

```
sage: m = ModularForms(Gamma0(20),4)
sage: m.rank()
12
sage: m.dimension()
12
```

set_precision(*n*)

Set the default precision for displaying elements of this space.

EXAMPLES:

```
sage: m = ModularForms(Gamma1(5),2)
sage: m.set_precision(10)
sage: m.basis()
[
```

```
1 + 60*q^3 - 120*q^4 + 240*q^5 - 300*q^6 + 300*q^7 - 180*q^9 + O(q^10),
q + 6*q^3 - 9*q^4 + 27*q^5 - 28*q^6 + 30*q^7 - 11*q^9 + O(q^10),
q^2 - 4*q^3 + 12*q^4 - 22*q^5 + 30*q^6 - 24*q^7 + 5*q^8 + 18*q^9 + O(q^10)
]
sage: m.set_precision(5)
sage: m.basis()
[
1 + 60*q^3 - 120*q^4 + O(q^5),
q + 6*q^3 - 9*q^4 + O(q^5),
q^2 - 4*q^3 + 12*q^4 + O(q^5)
]
```

45.17 Compute spaces of half-integral weight modular forms.

Based on an algorithm in Basmaji's thesis.

AUTHORS:

- William Stein (2007-08)

half_integral_weight_modform_basis(*chi, k, prec*)

A basis for the space of weight $k/2$ forms with character χ. The modulus of χ must be divisible by 16 and k must be odd and > 1.

INPUT:

- `chi` - a Dirichlet character with modulus divisible by 16
- `k` - an odd integer = 1
- `prec` - a positive integer

OUTPUT: a list of power series

Warning:

1. This code is very slow because it requests computation of a basis of modular forms for integral weight spaces, and that computation is still very slow.
2. If you give an input prec that is too small, then the output list of power series may be larger than the dimension of the space of half-integral forms.

EXAMPLES:

We compute some half-integral weight forms of level 16*7

```
sage: half_integral_weight_modform_basis(DirichletGroup(16*7).0^2,3,30)
[q - 2*q^2 - q^9 + 2*q^14 + 6*q^18 - 2*q^21 - 4*q^22 - q^25 + O(q^30),
 q^2 - q^14 - 3*q^18 + 2*q^22 + O(q^30),
 q^4 - q^8 - q^16 + q^28 + O(q^30),
 q^7 - 2*q^15 + O(q^30)]
```

The following illustrates that choosing too low of a precision can give an incorrect answer.

```
sage: half_integral_weight_modform_basis(DirichletGroup(16*7).0^2,3,20)
[q - 2*q^2 - q^9 + 2*q^14 + 6*q^18 + O(q^20),
 q^2 - q^14 - 3*q^18 + O(q^20),
 q^4 - 2*q^8 + 2*q^12 - 4*q^16 + O(q^20),
```

```
 q^7 - 2*q^8 + 4*q^12 - 2*q^15 - 6*q^16 + O(q^20),
 q^8 - 2*q^12 + 3*q^16 + O(q^20)]
```

We compute some spaces of low level and the first few possible weights.

```
sage: half_integral_weight_modform_basis(DirichletGroup(16,QQ).1, 3, 10)
[]
sage: half_integral_weight_modform_basis(DirichletGroup(16,QQ).1, 5, 10)
[q - 2*q^3 - 2*q^5 + 4*q^7 - q^9 + O(q^10)]
sage: half_integral_weight_modform_basis(DirichletGroup(16,QQ).1, 7, 10)
[q - 2*q^2 + 4*q^3 + 4*q^4 - 10*q^5 - 16*q^7 + 19*q^9 + O(q^10),
 q^2 - 2*q^3 - 2*q^4 + 4*q^5 + 4*q^7 - 8*q^9 + O(q^10),
 q^3 - 2*q^5 - 2*q^7 + 4*q^9 + O(q^10)]
sage: half_integral_weight_modform_basis(DirichletGroup(16,QQ).1, 9, 10)
[q - 2*q^2 + 4*q^3 - 8*q^4 + 14*q^5 + 16*q^6 - 40*q^7 + 16*q^8 - 57*q^9 + O(q^10),
 q^2 - 2*q^3 + 4*q^4 - 8*q^5 - 8*q^6 + 20*q^7 - 8*q^8 + 32*q^9 + O(q^10),
 q^3 - 2*q^4 + 4*q^5 + 4*q^6 - 10*q^7 - 16*q^9 + O(q^10),
 q^4 - 2*q^5 - 2*q^6 + 4*q^7 + 4*q^9 + O(q^10),
 q^5 - 2*q^7 - 2*q^9 + O(q^10)]
```

This example once raised an error (see trac #5792).

```
sage: half_integral_weight_modform_basis(trivial_character(16),9,10)
[q - 2*q^2 + 4*q^3 - 8*q^4 + 4*q^6 - 16*q^7 + 48*q^8 - 15*q^9 + O(q^10),
 q^2 - 2*q^3 + 4*q^4 - 2*q^6 + 8*q^7 - 24*q^8 + O(q^10),
 q^3 - 2*q^4 - 4*q^7 + 12*q^8 + O(q^10),
 q^4 - 6*q^8 + O(q^10)]
```

ALGORITHM: Basmaji (page 55 of his Essen thesis, "Ein Algorithmus zur Berechnung von Hecke-Operatoren und Anwendungen auf modulare Kurven", http://wstein.org/scans/papers/basmaji/).

Let $S = S_{k+1}(\epsilon)$ be the space of cusp forms of even integer weight $k+1$ and character $\varepsilon = \chi\psi^{(k+1)/2}$, where ψ is the nontrivial mod-4 Dirichlet character. Let U be the subspace of $S \times S$ of elements (a, b) such that $\Theta_2 a = \Theta_3 b$. Then U is isomorphic to $S_{k/2}(\chi)$ via the map $(a, b) \mapsto a/\Theta_3$.

45.18 Graded Rings of Modular Forms

This module contains functions to find generators for the graded ring of modular forms of given level.

AUTHORS:

- William Stein (2007-08-24): first version

class ModularFormsRing (*group*)

The ring of modular forms (of weights 0 or at least 2) for a congruence subgroup of $\mathrm{SL}_2(\mathbf{Z})$.

EXAMPLES:

```
sage: ModularFormsRing(Gamma1(13))
Ring of modular forms for Congruence Subgroup Gamma1(13) of weights 0 and at least 2
sage: m = ModularFormsRing(4); m
Ring of modular forms for Congruence Subgroup Gamma0(4)
sage: m.modular_forms_of_weight(2)
Modular Forms space of dimension 2 for Congruence Subgroup Gamma0(4) of weight 2 over Rational F
sage: m.modular_forms_of_weight(10)
Modular Forms space of dimension 6 for Congruence Subgroup Gamma0(4) of weight 10 over Rational
```

```
sage: m == loads(dumps(m))
True
sage: m.generators()
[(2, 1 + 24*q^2 + 24*q^4 + 96*q^6 + 24*q^8 + O(q^10)),
(2, q + 4*q^3 + 6*q^5 + 8*q^7 + 13*q^9 + O(q^10))]
sage: m.q_expansion_basis(2,10)
[1 + 24*q^2 + 24*q^4 + 96*q^6 + 24*q^8 + O(q^10),
 q + 4*q^3 + 6*q^5 + 8*q^7 + 13*q^9 + O(q^10)]
sage: m.q_expansion_basis(3,10)
[]
sage: m.q_expansion_basis(10,10)
[1 + 10560*q^6 + 3960*q^8 + O(q^10),
 q - 8056*q^7 - 30855*q^9 + O(q^10),
 q^2 - 796*q^6 - 8192*q^8 + O(q^10),
 q^3 + 66*q^7 + 832*q^9 + O(q^10),
 q^4 + 40*q^6 + 528*q^8 + O(q^10),
 q^5 + 20*q^7 + 190*q^9 + O(q^10)]
```

generators (*prec=10, maxweight=20*)

Calculate modular forms generating a subring that contains all forms of weight up to maxweight (default 20).

EXAMPLES:

```
sage: ModularFormsRing(SL2Z).generators()
[(4, 1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + 60480*q^6 + 82560*q^7 + 14040
sage: ModularFormsRing(SL2Z).generators(maxweight=5)
[(4, 1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + 60480*q^6 + 82560*q^7 + 14040
```

modular_forms_of_weight (*weight*)

Return the space of modular forms on this group of the given weight.

EXAMPLES:

```
sage: R = ModularFormsRing(13)
sage: R.modular_forms_of_weight(10)
Modular Forms space of dimension 11 for Congruence Subgroup Gamma0(13) of weight 10 over Rat
sage: ModularFormsRing(Gamma1(13)).modular_forms_of_weight(3)
Modular Forms space of dimension 20 for Congruence Subgroup Gamma1(13) of weight 3 over Rati
```

q_expansion_basis (*weight, prec=None*)

Calculate a basis of q-expansions for the space of modular forms of the given weight for this group, calculated using the ring generators given by `find_generators`.

EXAMPLES:

```
sage: m = ModularFormsRing(Gamma0(4))
sage: m.q_expansion_basis(2,10)
[1 + 24*q^2 + 24*q^4 + 96*q^6 + 24*q^8 + O(q^10),
q + 4*q^3 + 6*q^5 + 8*q^7 + 13*q^9 + O(q^10)]
sage: m.q_expansion_basis(3,10)
[]
```

basis_for_modform_space (*gens, group, weight*)

Given a list of pairs `(k,f)` of a weight and a modular form of that weight, and a target weight l, return a basis of q-expansions for the weight l part of the graded algebra generated by those forms (which may or may not be the whole space of weight l forms for the given group).

EXAMPLES:

```
sage: X = ModularFormsRing(SL2Z).generators()
sage: sage.modular.modform.find_generators.basis_for_modform_space(X, SL2Z, 12)
[1 + 196560*q^2 + 16773120*q^3 + 398034000*q^4 + 4629381120*q^5 + 34417656000*q^6 + 187489935360
q - 24*q^2 + 252*q^3 - 1472*q^4 + 4830*q^5 - 6048*q^6 - 16744*q^7 + 84480*q^8 - 113643*q^9 + O(q
```

modform_generators (*group, maxweight=20, prec=None, start_gens=, [], start_weight=2*)

Find modular forms in $M_k(group)$ for $k \leq maxweight$, such that these forms generate – as an algebra – all forms on group of weight up to maxweight, where all forms are computed as q-expansions to precision prec.

INPUT:

- `group` – a level or a congruence subgroup
- `maxweight` – integer
- `prec` – integer (default: twice largest dimension)
- `start_gens` – list of pairs (k,f) where k is an integer and f is a power series (default: []); if given, we assume the given pairs (k,f) are q-expansions of modular form of the given weight, and start creating modular forms generators using them.
- `start_weight` – an integer (default: 2)

OUTPUT:

a list of pairs (k, f), where f is the q-expansion of a modular form of weight k.

EXAMPLES:

```
sage: import sage.modular.modform.find_generators as fg
sage: forms = [(4, 240*eisenstein_series_qexp(4,5)), (6,504*eisenstein_series_qexp(6,5))]
sage: fg.multiply_forms_to_weight(forms, 12)
[(12, 1 - 1008*q + 220752*q^2 + 16519104*q^3 + 399517776*q^4 + O(q^5)), (12, 1 + 720*q + 179280*
sage: fg.multiply_forms_to_weight(forms, 24)
[(24, 1 - 2016*q + 1457568*q^2 - 411997824*q^3 + 16227967392*q^4 + O(q^5)), (24, 1 - 288*q - 325
sage: dimension_modular_forms(SL2Z,24)
3

sage: fg.modform_generators(1)
[(4, 1 + 240*q + 2160*q^2 + 6720*q^3 + O(q^4)), (6, 1 - 504*q - 16632*q^2 - 122976*q^3 + O(q^4))
sage: fg.modform_generators(2)
[(2, 1 + 24*q + 24*q^2 + 96*q^3 + 24*q^4 + 144*q^5 + 96*q^6 + 192*q^7 + 24*q^8 + 312*q^9 + 144*q
sage: fg.modform_generators(4, 12, 20)
[(2, 1 + 24*q^2 + 24*q^4 + 96*q^6 + 24*q^8 + 144*q^10 + 96*q^12 + 192*q^14 + 24*q^16 + 312*q^18
```

Here we see that for `\Gamma_0(11)` taking a basis of forms in weights 2 and 4 is enough to generate everything up to weight 12 (and probably everything else).:

```
sage: v = fg.modform_generators(11, 12)
sage: len(v)
3
sage: [k for k, _ in v]
[2, 2, 4]
sage: dimension_modular_forms(11,2)
2
sage: dimension_modular_forms(11,4)
4
```

For congruence subgroups not -1, we miss out some forms since we can't calculate weight 1 forms at present, but we can still find generators for the ring of forms of weight ≥ 2:

```
sage: fg.modform_generators(Gamma1(4), prec=10, maxweight=10)
[(2, 1 + 24*q^2 + 24*q^4 + 96*q^6 + 24*q^8 + O(q^10)),
(2, q + 4*q^3 + 6*q^5 + 8*q^7 + 13*q^9 + O(q^10)),
(3, 1 + 12*q^2 + 64*q^3 + 60*q^4 + 160*q^6 + 384*q^7 + 252*q^8 + O(q^10)),
(3, q + 4*q^2 + 8*q^3 + 16*q^4 + 26*q^5 + 32*q^6 + 48*q^7 + 64*q^8 + 73*q^9 + O(q^10))]
```

multiply_forms_to_weight (*forms, weight, stop_dim=None*)

Given a list of pairs `(k,f)`, where k is an integer and f is a power series, and a weight l, return all weight l forms obtained by multiplying together the given forms.

INPUT:

- forms – list of pairs (k, f) with k an integer and f a power series
- weight – an integer
- stop_dim – integer (optional): if set to an integer and we find that the series so far span a space of at least this dimension, then stop multiplying more forms together.

EXAMPLES:

```
sage: import sage.modular.modform.find_generators as f
sage: forms = [(4, 240*eisenstein_series_qexp(4,5)), (6,504*eisenstein_series_qexp(6,5))]
sage: f.multiply_forms_to_weight(forms, 12)
[(12, 1 - 1008*q + 220752*q^2 + 16519104*q^3 + 399517776*q^4 + O(q^5)), (12, 1 + 720*q + 179280*
sage: f.multiply_forms_to_weight(forms, 24)
[(24, 1 - 2016*q + 1457568*q^2 - 411997824*q^3 + 16227967392*q^4 + O(q^5)), (24, 1 - 288*q - 325
sage: dimension_modular_forms(SL2Z,24)
3
```

span_of_series (*v, prec=None, basis=False*)

Return the free module spanned by the given list of power series or objects with a padded_list method. If prec is not given, the precision used is the minimum of the precisions of the elements in the list (as determined by a prec method).

INPUT:

- v – a list of power series
- prec – optional; if given then the series do not have to be of finite precision, and will be considered to have precision prec.
- basis – (default: False) if True the input is assumed to determine linearly independent vectors, and the resulting free module has that as basis.

OUTPUT:

A free module of rank prec over the base ring of the forms (actually, of the first form in the list). If the list is empty, the free module is over QQ.

EXAMPLES:

An example involving modular forms:

```
sage: from sage.modular.modform.find_generators import span_of_series
sage: v = ModularForms(11,2, prec=5).basis(); v
[
q - 2*q^2 - q^3 + 2*q^4 + O(q^5),
1 + 12/5*q + 36/5*q^2 + 48/5*q^3 + 84/5*q^4 + O(q^5)
]
sage: span_of_series(v)
Vector space of degree 5 and dimension 2 over Rational Field
Basis matrix:
```

```
[ 1  0 12 12 12]
[ 0  1 -2 -1  2]
```

Next we make sure the vectors give a basis:

```
sage: span_of_series(v,basis=True)
Vector space of degree 5 and dimension 2 over Rational Field
User basis matrix:
[   0    1   -2   -1    2]
[   1 12/5 36/5 48/5 84/5]
```

An example involving power series.:

```
sage: R.<x> = PowerSeriesRing(QQ, default_prec=5)
sage: v = [1/(1-x), 1/(1+x), 2/(1+x), 2/(1-x)]; v
[1 + x + x^2 + x^3 + x^4 + O(x^5),
 1 - x + x^2 - x^3 + x^4 + O(x^5),
 2 - 2*x + 2*x^2 - 2*x^3 + 2*x^4 + O(x^5),
 2 + 2*x + 2*x^2 + 2*x^3 + 2*x^4 + O(x^5)]
sage: span_of_series(v)
Vector space of degree 5 and dimension 2 over Rational Field
Basis matrix:
[1 0 1 0 1]
[0 1 0 1 0]
sage: span_of_series(v,10)
Vector space of degree 10 and dimension 2 over Rational Field
Basis matrix:
[1 0 1 0 1 0 0 0 0 0]
[0 1 0 1 0 0 0 0 0 0]
```

An example involving polynomials.:

```
sage: x = polygen(QQ)
sage: span_of_series([x^3, 2*x^2 + 17*x^3, x^2])
...
ValueError: please specify a precision
sage: span_of_series([x^3, 2*x^2 + 17*x^3, x^2],5)
Vector space of degree 5 and dimension 2 over Rational Field
Basis matrix:
[0 0 1 0 0]
[0 0 0 1 0]
sage: span_of_series([x^3, 2*x^2 + 17*x^3, x^2],3)
Vector space of degree 3 and dimension 1 over Rational Field
Basis matrix:
[0 0 1]
```

CHAPTER

FORTYSIX

MODULAR ABELIAN VARIETIES

46.1 Constructors for certain modular abelian varieties.

AUTHORS:

- William Stein (2007-03)

AbelianVariety(X)

Create the abelian variety corresponding to the given defining data.

INPUT:

- X - an integer, string, newform, modsym space, congruence subgroup or tuple of congruence subgroups

OUTPUT: a modular abelian variety

EXAMPLES:

```
sage: AbelianVariety(Gamma0(37))
Abelian variety J0(37) of dimension 2
sage: AbelianVariety('37a')
Newform abelian subvariety 37a of dimension 1 of J0(37)
sage: AbelianVariety(Newform('37a'))
Newform abelian subvariety 37a of dimension 1 of J0(37)
sage: AbelianVariety(ModularSymbols(37).cuspidal_submodule())
Abelian variety J0(37) of dimension 2
sage: AbelianVariety((Gamma0(37), Gamma0(11)))
Abelian variety J0(37) x J0(11) of dimension 3
sage: AbelianVariety(37)
Abelian variety J0(37) of dimension 2
sage: AbelianVariety([1,2,3])
...
TypeError: X must be an integer, string, newform, modsym space, congruence subgroup or tuple of
```

J0(N)

Return the Jacobian $J_0(N)$ of the modular curve $X_0(N)$.

EXAMPLES:

```
sage: J0(389)
Abelian variety J0(389) of dimension 32
```

The result is cached:

```
sage: J0(33) is J0(33)
True
```

J1(*N*)
Return the Jacobian $J_1(N)$ of the modular curve $X_1(N)$.

EXAMPLES:

```
sage: J1(389)
Abelian variety J1(389) of dimension 6112
```

JH(*N*, *H*)
Return the Jacobian $J_H(N)$ of the modular curve $X_H(N)$.

EXAMPLES:

```
sage: JH(389,[2])
Abelian variety JH(389,[2]) of dimension 32
```

46.2 Base class for modular abelian varieties

AUTHORS:

- William Stein (2007-03)

TESTS:

```
sage: A = J0(33)
sage: D = A.decomposition(); D
[
Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33),
Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33),
Simple abelian subvariety 33a(1,33) of dimension 1 of J0(33)
]
sage: loads(dumps(D)) == D
True
sage: loads(dumps(A)) == A
True
```

class ModularAbelianVariety(*groups, lattice=None, base_field=Rational Field, is_simple=None, newform_level=None, isogeny_number=None, number=None, check=True*)

lattice()
Return the lattice that defines this abelian variety.

OUTPUT:

•`lattice` - a lattice embedded in the rational homology of the ambient product Jacobian

EXAMPLES:

```
sage: A = (J0(11) * J0(37))[1]; A
Simple abelian subvariety 37a(1,37) of dimension 1 of J0(11) x J0(37)
sage: type(A)
<class 'sage.modular.abvar.abvar.ModularAbelianVariety'>
sage: A.lattice()
Free module of degree 6 and rank 2 over Integer Ring
```

```
Echelon basis matrix:
[ 0  0  1 -1  1  0]
[ 0  0  0  0  2 -1]
```

class ModularAbelianVariety_abstract(*groups, base_field, is_simple=None, newform_level=None, isogeny_number=None, number=None, check=True*)

ambient_morphism()

Return the morphism from self to the ambient variety. This is injective if self is natural a subvariety of the ambient product Jacobian.

OUTPUT: morphism

The output is cached.

EXAMPLES: We compute the ambient structure morphism for an abelian subvariety of $J_0(33)$:

```
sage: A,B,C = J0(33)
sage: phi = A.ambient_morphism()
sage: phi.domain()
Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33)
sage: phi.codomain()
Abelian variety J0(33) of dimension 3
sage: phi.matrix()
[ 1  1 -2  0  2 -1]
[ 0  3 -2 -1  2  0]
```

phi is of course injective

```
sage: phi.kernel()
(Finite subgroup with invariants [] over QQ of Simple abelian subvariety 11a(1,33) of dimens
 Abelian subvariety of dimension 0 of J0(33))
```

This is the same as the basis matrix for the lattice corresponding to self:

```
sage: A.lattice()
Free module of degree 6 and rank 2 over Integer Ring
Echelon basis matrix:
[ 1  1 -2  0  2 -1]
[ 0  3 -2 -1  2  0]
```

We compute a non-injective map to an ambient space:

```
sage: Q,pi = J0(33)/A
sage: phi = Q.ambient_morphism()
sage: phi.matrix()
[  1   4   1   9  -1  -1]
[  0  15   0   0  30 -75]
[  0   0   5  10  -5  15]
[  0   0   0  15 -15  30]
sage: phi.kernel()[0]
Finite subgroup with invariants [5, 15, 15] over QQ of Abelian variety factor of dimension 2
```

ambient_variety()

Return the ambient modular abelian variety that contains this abelian variety. The ambient variety is always a product of Jacobians of modular curves.

OUTPUT: abelian variety

EXAMPLES:

```
sage: A = J0(33)[0]; A
Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33)
sage: A.ambient_variety()
Abelian variety J0(33) of dimension 3
```

base_extend(*K*)

EXAMPLES:

```
sage: A = J0(37); A
Abelian variety J0(37) of dimension 2
sage: A.base_extend(QQbar)
Abelian variety J0(37) over Algebraic Field of dimension 2
sage: A.base_extend(GF(7))
Abelian variety J0(37) over Finite Field of size 7 of dimension 2
```

base_field()

Synonym for `self.base_ring()`.

EXAMPLES:

```
sage: J0(11).base_field()
Rational Field
```

category()

Return the category of modular abelian varieties that contains this modular abelian variety.

EXAMPLES:

```
sage: J0(23).category()
Category of modular abelian varieties over Rational Field
```

change_ring(*R*)

Change the base ring of this modular abelian variety.

EXAMPLES:

```
sage: A = J0(23)
sage: A.change_ring(QQ)
Abelian variety J0(23) of dimension 2
```

complement(*A=None*)

Return a complement of this abelian variety.

INPUT:

- `A` - (default: None); if given, A must be an abelian variety that contains self, in which case the complement of self is taken inside A. Otherwise the complement is taken in the ambient product Jacobian.

OUTPUT: abelian variety

EXAMPLES:

```
sage: a,b,c = J0(33)
sage: (a+b).complement()
Simple abelian subvariety 33a(1,33) of dimension 1 of J0(33)
sage: (a+b).complement() == c
True
sage: a.complement(a+b)
Abelian subvariety of dimension 1 of J0(33)
```

cuspidal_subgroup()

Return the cuspidal subgroup of this modular abelian variety. This is the subgroup generated by rational cusps.

EXAMPLES:

```
sage: J = J0(54)
sage: C = J.cuspidal_subgroup()
sage: C.gens()
[[(1/3, 0, 0, 0, 0, 1/3, 0, 2/3)], [(0, 1/3, 0, 0, 0, 2/3, 0, 1/3)], [(0, 0, 1/9, 1/9, 1/9,
```

```
sage: C.invariants()
[3, 3, 3, 3, 3, 9]
sage: J1(13).cuspidal_subgroup()
Finite subgroup with invariants [19, 19] over QQ of Abelian variety J1(13) of dimension 2
sage: A = J0(33)[0]
sage: A.cuspidal_subgroup()
Finite subgroup with invariants [5] over QQ of Simple abelian subvariety 11a(1,33) of dimens
```

decomposition(*simple=True, bound=None*)

Return a sequence of abelian subvarieties of self that are all simple, have finite intersection and sum to self.

INPUT: simple- bool (default: True) if True, all factors are simple. If False, each factor returned is isogenous to a power of a simple and the simples in each factor are distinct.

- `bound` - int (default: None) if given, only use Hecke operators up to this bound when decomposing. This can give wrong answers, so use with caution!

EXAMPLES:

```
sage: m = ModularSymbols(11).cuspidal_submodule()
sage: d1 = m.degeneracy_map(33,1).matrix(); d3=m.degeneracy_map(33,3).matrix()
sage: w = ModularSymbols(33).submodule((d1 + d3).image(), check=False)
sage: A = w.abelian_variety(); A
Abelian subvariety of dimension 1 of J0(33)
sage: D = A.decomposition(); D
[
Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33)
]
sage: D[0] == A
True
sage: B = A + J0(33)[0]; B
Abelian subvariety of dimension 2 of J0(33)
sage: dd = B.decomposition(simple=False); dd
[
Abelian subvariety of dimension 2 of J0(33)
]
sage: dd[0] == B
True
sage: dd = B.decomposition(); dd
[
Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33),
Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33)
]
sage: sum(dd) == B
True
```

We decompose a product of two Jacobians:

```
sage: (J0(33) * J0(11)).decomposition()
[
Simple abelian subvariety 11a(1,11) of dimension 1 of J0(33) x J0(11),
Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33) x J0(11),
Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33) x J0(11),
Simple abelian subvariety 33a(1,33) of dimension 1 of J0(33) x J0(11)
]
```

degen_t(*none_if_not_known=False*)

If this abelian variety is obtained via decomposition then it gets labeled with the newform label along with some information about degeneracy maps. In particular, the label ends in a pair (t, N), where N is the ambient level and t is an integer that divides the quotient of N by the newform level. This function returns

the tuple (t, N), or raises a ValueError if self isn't simple.

Note: It need not be the case that self is literally equal to the image of the newform abelian variety under the tth degeneracy map. See the documentation for the label method for more details.

INPUT:

- `none_if_not_known` - (default: False) - if True, return None instead of attempting to compute the degen map's t, if it isn't known. This None result is not cached.

OUTPUT: a pair (integer, integer)

EXAMPLES:

```
sage: D = J0(33).decomposition(); D
[
Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33),
Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33),
Simple abelian subvariety 33a(1,33) of dimension 1 of J0(33)
]
sage: D[0].degen_t()
(1, 33)
sage: D[1].degen_t()
(3, 33)
sage: D[2].degen_t()
(1, 33)
sage: J0(33).degen_t()
...
ValueError: self must be simple
```

degeneracy_map (*M_ls, t_ls*)

Return the degeneracy map with domain self and given level/parameter. If self.ambient_variety() is a product of Jacobians (as opposed to a single Jacobian), then one can provide a list of new levels and parameters, corresponding to the ambient Jacobians in order. (See the examples below.)

INPUT:

- `M, t` - integers level and t, or
- `Mlist, tlist` - if self is in a nontrivial product ambient Jacobian, input consists of a list of levels and corresponding list of t's.

OUTPUT: a degeneracy map

EXAMPLES: We make several degeneracy maps related to $J_0(11)$ and $J_0(33)$ and compute their matrices.

```
sage: d1 = J0(11).degeneracy_map(33, 1); d1
Degeneracy map from Abelian variety J0(11) of dimension 1 to Abelian variety J0(33) of dimen
sage: d1.matrix()
[ 0 -3  2  1 -2  0]
[ 1 -2  0  1  0 -1]
sage: d2 = J0(11).degeneracy_map(33, 3); d2
Degeneracy map from Abelian variety J0(11) of dimension 1 to Abelian variety J0(33) of dimen
sage: d2.matrix()
[-1  0  0  0  1 -2]
[-1 -1  1 -1  1  0]
sage: d3 = J0(33).degeneracy_map(11, 1); d3
Degeneracy map from Abelian variety J0(33) of dimension 3 to Abelian variety J0(11) of dimen
```

He we verify that first mapping from level 11 to level 33, then back is multiplication by 4:

```
sage: d1.matrix() * d3.matrix()
[4 0]
[0 4]
```

We compute a more complicated degeneracy map involving nontrivial product ambient Jacobians; note that this is just the block direct sum of the two matrices at the beginning of this example:

```
sage: d = (J0(11)*J0(11)).degeneracy_map([33,33], [1,3]); d
Degeneracy map from Abelian variety J0(11) x J0(11) of dimension 2 to Abelian variety J0(33)
sage: d.matrix()
[ 0 -3  2  1 -2  0  0  0  0  0  0  0]
[ 1 -2  0  1  0 -1  0  0  0  0  0  0]
[ 0  0  0  0  0  0 -1  0  0  0  1 -2]
[ 0  0  0  0  0  0 -1 -1  1 -1  1  0]
```

degree()

Return the degree of this abelian variety, which is the dimension of the ambient Jacobian product.

EXAMPLES:

```
sage: A = J0(23)
sage: A.dimension()
2
```

dimension()

Return the dimension of this abelian variety.

EXAMPLES:

```
sage: A = J0(23)
sage: A.dimension()
2
```

direct_product(*other*)

Compute the direct product of self and other.

INPUT:

- `self, other` - modular abelian varieties

OUTPUT: abelian variety

EXAMPLES:

```
sage: J0(11).direct_product(J1(13))
Abelian variety J0(11) x J1(13) of dimension 3
sage: A = J0(33)[0].direct_product(J0(33)[1]); A
Abelian subvariety of dimension 2 of J0(33) x J0(33)
sage: A.lattice()
Free module of degree 12 and rank 4 over Integer Ring
Echelon basis matrix:
[ 1  1 -2  0  2 -1  0  0  0  0  0  0]
[ 0  3 -2 -1  2  0  0  0  0  0  0  0]
[ 0  0  0  0  0  0  1  0  0  0 -1  2]
[ 0  0  0  0  0  0  0  1 -1  1  0 -2]
```

dual()

Return the dual of this abelian variety.

OUTPUT: abelian variety

Warning: This is currently only implemented when self is an abelian subvariety of the ambient Jacobian product, and the complement of self in the ambient product Jacobian share no common factors. A more general implementation will require implementing computation of the intersection pairing on integral homology and the resulting Weil pairing on torsion.

EXAMPLES: We compute the dual of the elliptic curve newform abelian variety of level 33, and find the kernel of the modular map, which has structure $(\mathbf{Z}/3)^2$.

```
sage: A,B,C = J0(33)
sage: C
```

```
Simple abelian subvariety 33a(1,33) of dimension 1 of J0(33)
sage: Cd, f = C.dual()
sage: f.matrix()
[3 0]
[0 3]
sage: f.kernel()[0]
Finite subgroup with invariants [3, 3] over QQ of Simple abelian subvariety 33a(1,33) of dim
```

By a theorem the modular degree must thus be 3:

```
sage: E = EllipticCurve('33a')
sage: E.modular_degree()
3
```

Next we compute the dual of a 2-dimensional new simple abelian subvariety of $J_0(43)$.

```
sage: A = AbelianVariety('43b'); A
Newform abelian subvariety 43b of dimension 2 of J0(43)
sage: Ad, f = A.dual()
```

The kernel shows that the modular degree is 2:

```
sage: f.kernel()[0]
Finite subgroup with invariants [2, 2] over QQ of Newform abelian subvariety 43b of dimensio
```

Unfortunately, the dual is not implemented in general:

```
sage: A = J0(22)[0]; A
Simple abelian subvariety 11a(1,22) of dimension 1 of J0(22)
sage: A.dual()
...
NotImplementedError: dual not implemented unless complement shares no simple factors with se
```

endomorphism_ring()

Return the endomorphism ring of self.

OUTPUT: b = self.sturm_bound()

EXAMPLES: We compute a few endomorphism rings:

```
sage: J0(11).endomorphism_ring()
Endomorphism ring of Abelian variety J0(11) of dimension 1
sage: J0(37).endomorphism_ring()
Endomorphism ring of Abelian variety J0(37) of dimension 2
sage: J0(33)[2].endomorphism_ring()
Endomorphism ring of Simple abelian subvariety 33a(1,33) of dimension 1 of J0(33)
```

No real computation is done:

```
sage: J1(123456).endomorphism_ring()
Endomorphism ring of Abelian variety J1(123456) of dimension 423185857
```

finite_subgroup(*X, field_of_definition=None, check=True*)

Return a finite subgroup of this modular abelian variety.

INPUT:

- `X` - list of elements of other finite subgroups of this modular abelian variety or elements that coerce into the rational homology (viewed as a rational vector space); also X could be a finite subgroup itself that is contained in this abelian variety.
- `field_of_definition` - (default: None) field over which this group is defined. If None try to figure out the best base field.

OUTPUT: a finite subgroup of a modular abelian variety

EXAMPLES:

```
sage: J = J0(11)
sage: J.finite_subgroup([[1/5,0], [0,1/3]])
Finite subgroup with invariants [15] over QQbar of Abelian variety J0(11) of dimension 1

sage: J = J0(33); C = J[0].cuspidal_subgroup(); C
Finite subgroup with invariants [5] over QQ of Simple abelian subvariety 11a(1,33) of dimens
sage: J.finite_subgroup([[0,0,0,0,0,1/6]])
Finite subgroup with invariants [6] over QQbar of Abelian variety J0(33) of dimension 3
sage: J.finite_subgroup(C)
Finite subgroup with invariants [5] over QQ of Abelian variety J0(33) of dimension 3
```

free_module()

Synonym for `self.lattice()`.

OUTPUT: a free module over $\mathbf{Z}$

EXAMPLES:

```
sage: J0(37).free_module()
Ambient free module of rank 4 over the principal ideal domain Integer Ring
sage: J0(37)[0].free_module()
Free module of degree 4 and rank 2 over Integer Ring
Echelon basis matrix:
[ 1 -1  1  0]
[ 0  0  2 -1]
```

groups()

Return an ordered tuple of the congruence subgroups that the ambient product Jacobian is attached to.

Every modular abelian variety is a finite quotient of an abelian subvariety of a product of modular Jacobians J_Γ. This function returns a tuple containing the groups Γ.

EXAMPLES:

```
sage: A = (J0(37) * J1(13))[0]; A
Simple abelian subvariety 13aG1(1,13) of dimension 2 of J0(37) x J1(13)
sage: A.groups()
(Congruence Subgroup Gamma0(37), Congruence Subgroup Gamma1(13))
```

hecke_operator(*n*)

Return the nth Hecke operator on the modular abelian variety, if this makes sense [[elaborate]]. Otherwise raise a ValueError.

EXAMPLES: We compute T_2 on $J_0(37)$.

```
sage: t2 = J0(37).hecke_operator(2); t2
Hecke operator T_2 on Abelian variety J0(37) of dimension 2
sage: t2.charpoly().factor()
x * (x + 2)
sage: t2.index()
2
```

Note that there is no matrix associated to Hecke operators on modular abelian varieties. For a matrix, instead consider, e.g., the Hecke operator on integral or rational homology.

```
sage: t2.action_on_homology().matrix()
[-1  1  1 -1]
[ 1 -1  1  0]
[ 0  0 -2  1]
[ 0  0  0  0]
```

hecke_polynomial(*n, var='x'*)

Return the characteristic polynomial of the nth Hecke operator T_n acting on self. Raises an ArithmeticError if self is not Hecke equivariant.

INPUT:

- n - integer ≥ 1
- var - string (default: 'x'); valid variable name

EXAMPLES:

```
sage: J0(33).hecke_polynomial(2)
x^3 + 3*x^2 - 4
sage: f = J0(33).hecke_polynomial(2, 'y'); f
y^3 + 3*y^2 - 4
sage: f.parent()
Univariate Polynomial Ring in y over Rational Field
sage: J0(33)[2].hecke_polynomial(3)
x + 1
sage: J0(33)[0].hecke_polynomial(5)
x - 1
sage: J0(33)[0].hecke_polynomial(11)
x - 1
sage: J0(33)[0].hecke_polynomial(3)
...
ArithmeticError: subspace is not invariant under matrix
```

homology(*base_ring=Integer Ring*)

Return the homology of this modular abelian variety.

Warning: For efficiency reasons the basis of the integral homology need not be the same as the basis for the rational homology.

EXAMPLES:

```
sage: J0(389).homology(GF(7))
Homology with coefficients in Finite Field of size 7 of Abelian variety J0(389) of dimension
sage: J0(389).homology(QQ)
Rational Homology of Abelian variety J0(389) of dimension 32
sage: J0(389).homology(ZZ)
Integral Homology of Abelian variety J0(389) of dimension 32
```

in_same_ambient_variety(*other*)

Return True if self and other are abelian subvarieties of the same ambient product Jacobian.

EXAMPLES:

```
sage: A,B,C = J0(33)
sage: A.in_same_ambient_variety(B)
True
sage: A.in_same_ambient_variety(J0(11))
False
```

integral_homology()

Return the integral homology of this modular abelian variety.

EXAMPLES:

```
sage: H = J0(43).integral_homology(); H
Integral Homology of Abelian variety J0(43) of dimension 3
sage: H.rank()
6
sage: H = J1(17).integral_homology(); H
Integral Homology of Abelian variety J1(17) of dimension 5
sage: H.rank()
10
```

If you just ask for the rank of the homology, no serious calculations are done, so the following is fast:

```
sage: H = J0(50000).integral_homology(); H
Integral Homology of Abelian variety J0(50000) of dimension 7351
sage: H.rank()
14702
```

A product:

```
sage: H = (J0(11) * J1(13)).integral_homology()
sage: H.hecke_operator(2)
Hecke operator T_2 on Integral Homology of Abelian variety J0(11) x J1(13) of dimension 3
sage: H.hecke_operator(2).matrix()
[-2  0  0  0  0  0]
[ 0 -2  0  0  0  0]
[ 0  0 -2  0 -1  1]
[ 0  0  1 -1  0 -1]
[ 0  0  1  1 -2  0]
[ 0  0  0  1 -1 -1]
```

intersection(*other*)

Returns the intersection of self and other inside a common ambient Jacobian product.

INPUT:

- `other` - a modular abelian variety or a finite group

OUTPUT: If other is a modular abelian variety:

- `G` - finite subgroup of self
- `A` - abelian variety (identity component of intersection) If other is a finite group:
- `G` - a finite group

EXAMPLES: We intersect some abelian varieties with finite intersection.

```
sage: J = J0(37)
sage: J[0].intersection(J[1])
(Finite subgroup with invariants [2, 2] over QQ of Simple abelian subvariety 37a(1,37) of di

sage: D = list(J0(65)); D
[Simple abelian subvariety 65a(1,65) of dimension 1 of J0(65), Simple abelian subvariety 65b
sage: D[0].intersection(D[1])
(Finite subgroup with invariants [2] over QQ of Simple abelian subvariety 65a(1,65) of dimen
sage: (D[0]+D[1]).intersection(D[1]+D[2])
(Finite subgroup with invariants [2] over QQbar of Abelian subvariety of dimension 3 of J0(6

sage: J = J0(33)
sage: J[0].intersection(J[1])
(Finite subgroup with invariants [5] over QQ of Simple abelian subvariety 11a(1,33) of dimen
```

Next we intersect two abelian varieties with non-finite intersection:

```
sage: J = J0(67); D = J.decomposition(); D
[
Simple abelian subvariety 67a(1,67) of dimension 1 of J0(67),
Simple abelian subvariety 67b(1,67) of dimension 2 of J0(67),
Simple abelian subvariety 67c(1,67) of dimension 2 of J0(67)
]
sage: (D[0] + D[1]).intersection(D[1] + D[2])
(Finite subgroup with invariants [5, 10] over QQbar of Abelian subvariety of dimension 3 of
```

is_ambient()

Return True if self equals the ambient product Jacobian.

OUTPUT: bool

EXAMPLES:

```
sage: A,B,C = J0(33)
sage: A.is_ambient()
False
sage: J0(33).is_ambient()
True
sage: (A+B).is_ambient()
False
sage: (A+B+C).is_ambient()
True
```

is_hecke_stable()

Return True if self is stable under the Hecke operators of its ambient Jacobian.

OUTPUT: bool

EXAMPLES:

```
sage: J0(11).is_hecke_stable()
True
sage: J0(33)[2].is_hecke_stable()
True
sage: J0(33)[0].is_hecke_stable()
False
sage: (J0(33)[0] + J0(33)[1]).is_hecke_stable()
True
```

is_simple(*none_if_not_known=False*)

Return whether or not this modular abelian variety is simple, i.e., has no proper nonzero abelian subvarieties.

INPUT:

- `none_if_not_known` - bool (default: False); if True then this function may return None instead of True of False if we don't already know whether or not self is simple.

EXAMPLES:

```
sage: J0(5).is_simple(none_if_not_known=True) is None  # this may fail if J0(5) comes up els
True
sage: J0(33).is_simple()
False
sage: J0(33).is_simple(none_if_not_known=True)
False
sage: J0(33)[1].is_simple()
True
sage: J1(17).is_simple()
False
```

is_subvariety(*other*)

Return True if self is a subvariety of other as they sit in a common ambient modular Jacobian. In particular, this function will only return True if self and other have exactly the same ambient Jacobians.

EXAMPLES:

```
sage: J = J0(37); J
Abelian variety J0(37) of dimension 2
sage: A = J[0]; A
Simple abelian subvariety 37a(1,37) of dimension 1 of J0(37)
sage: A.is_subvariety(A)
True
sage: A.is_subvariety(J)
True
```

is_subvariety_of_ambient_jacobian()

Return True if self is (presented as) a subvariety of the ambient product Jacobian.

Every abelian variety in Sage is a quotient of a subvariety of an ambient Jacobian product by a finite subgroup.

EXAMPLES:

```
sage: J0(33).is_subvariety_of_ambient_jacobian()
True
sage: A = J0(33)[0]; A
Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33)
sage: A.is_subvariety_of_ambient_jacobian()
True
sage: B, phi = A / A.torsion_subgroup(2)
sage: B
Abelian variety factor of dimension 1 of J0(33)
sage: phi.matrix()
[2 0]
[0 2]
sage: B.is_subvariety_of_ambient_jacobian()
False
```

isogeny_number(*none_if_not_known=False*)

Return the number (starting at 0) of the isogeny class of new simple abelian varieties that self is in. If self is not simple, raises a ValueError exception.

INPUT:

- `none_if_not_known` - bool (default: False); if True then this function may return None instead of True of False if we don't already know the isogeny number of self.

EXAMPLES: We test the none_if_not_known flag first:

```
sage: J0(33).isogeny_number(none_if_not_known=True) is None
True
```

Of course, $J_0(33)$ is not simple, so this function raises a ValueError:

```
sage: J0(33).isogeny_number()
...
ValueError: self must be simple
```

Each simple factor has isogeny number 1, since that's the number at which the factor is new.

```
sage: J0(33)[1].isogeny_number()
0
sage: J0(33)[2].isogeny_number()
0
```

Next consider $J_0(37)$ where there are two distinct newform factors:

```
sage: J0(37)[1].isogeny_number()
1
```

label()

Return the label associated to this modular abelian variety.

The format of the label is [level][isogeny class][group](t, ambient level)

If this abelian variety B has the above label, this implies only that B is isogenous to the newform abelian variety A_f associated to the newform with label [level][isogeny class][group]. The [group] is empty for $\Gamma_0(N)$, is G1 for $\Gamma_1(N)$ and is GH[...] for $\Gamma_H(N)$.

Warning: The sum of $\delta_s(A_f)$ for all $s \mid t$ contains A, but no sum for a proper divisor of t contains A. It need *not* be the case that B is equal to $\delta_t(A_f)$!!!

OUTPUT: string

EXAMPLES:

```
sage: J0(11).label()
'11a(1,11)'
sage: J0(11)[0].label()
'11a(1,11)'
sage: J0(33)[2].label()
'33a(1,33)'
sage: J0(22).label()
...
ValueError: self must be simple
```

We illustrate that self need not equal $\delta_t(A_f)$:

```
sage: J = J0(11); phi = J.degeneracy_map(33, 1) + J.degeneracy_map(33,3)
sage: B = phi.image(); B
Abelian subvariety of dimension 1 of J0(33)
sage: B.decomposition()
[
Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33)
]
sage: C = J.degeneracy_map(33,3).image(); C
Abelian subvariety of dimension 1 of J0(33)
sage: C == B
False
```

lattice()

Return lattice in ambient cuspidal modular symbols product that defines this modular abelian variety.

This must be defined in each derived class.

OUTPUT: a free module over $\mathbf{Z}$

EXAMPLES:

```
sage: A = sage.modular.abvar.abvar.ModularAbelianVariety_abstract((Gamma0(37),), QQ)
sage: A
...
NotImplementedError: BUG -- lattice method must be defined in derived class
```

level()

Return the level of this modular abelian variety, which is an integer N (usually minimal) such that this modular abelian variety is a quotient of $J_1(N)$. In the case that the ambient variety of self is a product of Jacobians, return the LCM of their levels.

EXAMPLES:

```
sage: J1(5077).level()
5077
sage: JH(389,[4]).level()
389
sage: (J0(11)*J0(17)).level()
187
```

lseries()

Return the complex L-series of this modular abelian variety.

EXAMPLES:

```
sage: A = J0(37)
sage: A.lseries()
Complex L-series attached to Abelian variety J0(37) of dimension 2
```

modular_degree()
Return the modular degree of this abelian variety, which is the square root of the degree of the modular kernel.

EXAMPLES:

```
sage: A = AbelianVariety('37a')
sage: A.modular_degree()
2
```

modular_kernel()
Return the modular kernel of this abelian variety, which is the kernel of the canonical polarization of self.

EXAMPLES:

```
sage: A = AbelianVariety('33a'); A
Newform abelian subvariety 33a of dimension 1 of J0(33)
sage: A.modular_kernel()
Finite subgroup with invariants [3, 3] over QQ of Newform abelian subvariety 33a of dimensio
```

newform_label()
Return the label [level][isogeny class][group] of the newform f such that this abelian variety is isogenous to the newform abelian variety A_f. If this abelian variety is not simple, raise a ValueError.

OUTPUT: string

EXAMPLES:

```
sage: J0(11).newform_label()
'11a'
sage: J0(33)[2].newform_label()
'33a'
```

The following fails since $J_0(33)$ is not simple:

```
sage: J0(33).newform_label()
...
ValueError: self must be simple
```

newform_level(*none_if_not_known=False*)
Write self as a product (up to isogeny) of newform abelian varieties A_f. Then this function return the least common multiple of the levels of the newforms f, along with the corresponding group or list of groups (the groups do not appear with multiplicity).

INPUT:

- `none_if_not_known` - (default: False) if True, return None instead of attempting to compute the newform level, if it isn't already known. This None result is not cached.

OUTPUT: integer group or list of distinct groups

EXAMPLES:

```
sage: J0(33)[0].newform_level()
(11, Congruence Subgroup Gamma0(33))
sage: J0(33)[0].newform_level(none_if_not_known=True)
(11, Congruence Subgroup Gamma0(33))
```

Here there are multiple groups since there are in fact multiple newforms:

```
sage: (J0(11) * J1(13)).newform_level()
(143, [Congruence Subgroup Gamma0(11), Congruence Subgroup Gamma1(13)])
```

padic_lseries(p)
Return the p-adic L-series of this modular abelian variety.

EXAMPLES:

```
sage: A = J0(37)
sage: A.padic_lseries(7)
7-adic L-series attached to Abelian variety J0(37) of dimension 2
```

project_to_factor(*n*)

If self is an ambient product of Jacobians, return a projection from self to the nth such Jacobian.

EXAMPLES:

```
sage: J = J0(33)
sage: J.project_to_factor(0)
Abelian variety endomorphism of Abelian variety J0(33) of dimension 3

sage: J = J0(33) * J0(37) * J0(11)
sage: J.project_to_factor(2)
Abelian variety morphism:
  From: Abelian variety J0(33) x J0(37) x J0(11) of dimension 6
  To:   Abelian variety J0(11) of dimension 1
sage: J.project_to_factor(2).matrix()
[0 0]
[0 0]
[0 0]
[0 0]
[0 0]
[0 0]
[0 0]
[0 0]
[0 0]
[0 0]
[1 0]
[0 1]
```

projection(*A, check=True*)

Given an abelian subvariety A of self, return a projection morphism from self to A. Note that this morphism need not be unique.

INPUT:

- A - an abelian variety

OUTPUT: a morphism

EXAMPLES:

```
sage: a,b,c = J0(33)
sage: pi = J0(33).projection(a); pi.matrix()
[ 3 -2]
[-5  5]
[-4  1]
[ 3 -2]
[ 5  0]
[ 1  1]
sage: pi = (a+b).projection(a); pi.matrix()
[ 0  0]
[-3  2]
[-4  1]
[-1 -1]
sage: pi = a.projection(a); pi.matrix()
[1 0]
[0 1]
```

We project onto a factor in a product of two Jacobians:

```
sage: A = J0(11)*J0(11); A
Abelian variety J0(11) x J0(11) of dimension 2
sage: A[0]
Simple abelian subvariety 11a(1,11) of dimension 1 of J0(11) x J0(11)
sage: A.projection(A[0])
Abelian variety morphism:
  From: Abelian variety J0(11) x J0(11) of dimension 2
  To:   Simple abelian subvariety 11a(1,11) of dimension 1 of J0(11) x J0(11)
sage: A.projection(A[0]).matrix()
[0 0]
[0 0]
[1 0]
[0 1]
sage: A.projection(A[1]).matrix()
[1 0]
[0 1]
[0 0]
[0 0]
```

qbar_torsion_subgroup()

Return the group of all points of finite order in the algebraic closure of this abelian variety.

EXAMPLES:

```
sage: T = J0(33).qbar_torsion_subgroup(); T
Group of all torsion points in QQbar on Abelian variety J0(33) of dimension 3
```

The field of definition is the same as the base field of the abelian variety.

```
sage: T.field_of_definition()
Rational Field
```

On the other hand, T is a module over $\mathbf{Z}$.

```
sage: T.base_ring()
Integer Ring
```

quotient(*other*)

Compute the quotient of self and other, where other is either an abelian subvariety of self or a finite subgroup of self.

INPUT:

- `other` - a finite subgroup or subvariety

OUTPUT: a pair (A, phi) with phi the quotient map from self to A

EXAMPLES: We quotient $J_0(33)$ out by an abelian subvariety:

```
sage: Q, f = J0(33).quotient(J0(33)[0])
sage: Q
Abelian variety factor of dimension 2 of J0(33)
sage: f
Abelian variety morphism:
  From: Abelian variety J0(33) of dimension 3
  To:   Abelian variety factor of dimension 2 of J0(33)
```

We quotient $J_0(33)$ by the cuspidal subgroup:

```
sage: C = J0(33).cuspidal_subgroup()
sage: Q, f = J0(33).quotient(C)
sage: Q
Abelian variety factor of dimension 3 of J0(33)
sage: f.kernel()[0]
```

```
Finite subgroup with invariants [10, 10] over QQ of Abelian variety J0(33) of dimension 3
sage: C
Finite subgroup with invariants [10, 10] over QQ of Abelian variety J0(33) of dimension 3
sage: J0(11).direct_product(J1(13))
Abelian variety J0(11) x J1(13) of dimension 3
```

rank()

Return the rank of the underlying lattice of self.

EXAMPLES:

```
sage: J = J0(33)
sage: J.rank()
6
sage: J[1]
Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33)
sage: (J[1] * J[1]).rank()
4
```

rational_cusp_subgroup()

Return the subgroup of this modular abelian variety generated by rational cusps.

This is a subgroup of the group of rational points in the cuspidal subgroup.

Warning: This is only currently implemented for $\Gamma_0(N)$.

EXAMPLES:

```
sage: J = J0(54)
sage: CQ = J.rational_cusp_subgroup(); CQ
Finite subgroup with invariants [3, 3, 9] over QQ of Abelian variety J0(54) of dimension 4
sage: CQ.gens()
[[(1/3, 0, 0, 1/3, 2/3, 1/3, 0, 1/3)], [(0, 0, 1/9, 1/9, 7/9, 7/9, 1/9, 8/9)], [(0, 0, 0, 0,
sage: factor(CQ.order())
3^4
sage: CQ.invariants()
[3, 3, 9]
```

In this example the rational cuspidal subgroup and the cuspidal subgroup differ by a lot.

```
sage: J = J0(49)
sage: J.cuspidal_subgroup()
Finite subgroup with invariants [2, 14] over QQ of Abelian variety J0(49) of dimension 1
sage: J.rational_cusp_subgroup()
Finite subgroup with invariants [2] over QQ of Abelian variety J0(49) of dimension 1
```

Note that computation of the rational cusp subgroup isn't implemented for Γ_1.

```
sage: J = J1(13)
sage: J.cuspidal_subgroup()
Finite subgroup with invariants [19, 19] over QQ of Abelian variety J1(13) of dimension 2
sage: J.rational_cusp_subgroup()
...
NotImplementedError: computation of rational cusps only implemented in Gamma0 case.
```

rational_homology()

Return the rational homology of this modular abelian variety.

EXAMPLES:

```
sage: H = J0(37).rational_homology(); H
Rational Homology of Abelian variety J0(37) of dimension 2
sage: H.rank()
```

```
4
sage: H.base_ring()
Rational Field
sage: H = J1(17).rational_homology(); H
Rational Homology of Abelian variety J1(17) of dimension 5
sage: H.rank()
10
sage: H.base_ring()
Rational Field
```

rational_torsion_subgroup()

Return the maximal torsion subgroup of self defined over QQ.

EXAMPLES:

```
sage: J = J0(33)
sage: A = J.new_subvariety()
sage: A
Abelian subvariety of dimension 1 of J0(33)
sage: t = A.rational_torsion_subgroup()
sage: t.multiple_of_order()
4
sage: t.divisor_of_order()
4
sage: t.order()
4
sage: t.gens()
[[(1/2, 0, 0, -1/2, 0, 0)], [(0, 0, 1/2, 0, 1/2, -1/2)]]
sage: t
Torsion subgroup of Abelian subvariety of dimension 1 of J0(33)
```

sturm_bound()

Return a bound B such that all Hecke operators T_n for $n \leq B$ generate the Hecke algebra.

OUTPUT: integer

EXAMPLES:

```
sage: J0(11).sturm_bound()
2
sage: J0(33).sturm_bound()
8
sage: J1(17).sturm_bound()
48
sage: J1(123456).sturm_bound()
1693483008
sage: JH(37,[2,3]).sturm_bound()
7
sage: J1(37).sturm_bound()
228
```

torsion_subgroup(n)

If n is an integer, return the subgroup of points of order n. Return the n-torsion subgroup of elements of order dividing n of this modular abelian variety A, i.e., the group $A[n]$.

EXAMPLES:

```
sage: J1(13).torsion_subgroup(19)
Finite subgroup with invariants [19, 19, 19, 19] over QQ of Abelian variety J1(13) of dimens
```

```
sage: A = J0(23)
sage: G = A.torsion_subgroup(5); G
```

```
Finite subgroup with invariants [5, 5, 5, 5] over QQ of Abelian variety J0(23) of dimension
sage: G.order()
625
sage: G.gens()
[[(1/5, 0, 0, 0)], [(0, 1/5, 0, 0)], [(0, 0, 1/5, 0)], [(0, 0, 0, 1/5)]]
sage: A = J0(23)
sage: A.torsion_subgroup(2).order()
16
```

vector_space()

Return vector space corresponding to the modular abelian variety.

This is the lattice tensored with $\mathbf{Q}$.

EXAMPLES:

```
sage: J0(37).vector_space()
Vector space of dimension 4 over Rational Field
sage: J0(37)[0].vector_space()
Vector space of degree 4 and dimension 2 over Rational Field
Basis matrix:
[   1   -1    0  1/2]
[   0    0    1 -1/2]
```

zero_subgroup()

Return the zero subgroup of this modular abelian variety, as a finite group.

EXAMPLES:

```
sage: A =J0(54); G = A.zero_subgroup(); G
Finite subgroup with invariants [] over QQ of Abelian variety J0(54) of dimension 4
sage: G.is_subgroup(A)
True
```

zero_subvariety()

Return the zero subvariety of self.

EXAMPLES:

```
sage: J = J0(37)
sage: J.zero_subvariety()
Simple abelian subvariety of dimension 0 of J0(37)
sage: J.zero_subvariety().level()
37
sage: J.zero_subvariety().newform_level()
(1, [])
```

class **ModularAbelianVariety_modsym**(*modsym, lattice=None, newform_level=None, is_simple=None, isogeny_number=None, number=None, check=True*)

brandt_module(*p*)

Return the Brandt module at p that corresponds to self. This is the factor of the vector space on the ideal class set in an order of level N in the quaternion algebra ramified at p and infinity.

INPUT: • p – prime that exactly divides the level

OUTPUT: • Brandt module space that corresponds to self.

EXAMPLES:

```
sage: J0(43)[1].brandt_module(43)
Subspace of dimension 2 of Brandt module of dimension 4 of level 43 of weight 2 over Rationa
sage: J0(43)[1].brandt_module(43).basis()
((1, 0, -1/2, -1/2), (0, 1, -1/2, -1/2))
sage: J0(43)[0].brandt_module(43).basis()
```

```
((0, 0, 1, -1),)
sage: J0(35)[0].brandt_module(5).basis()
((1, 0, -1, 0),)
sage: J0(35)[0].brandt_module(7).basis()
((1, -1, 1, -1),)
```

component_group_order(*p*)

Return the order of the component group of the special fiber at p of the Neron model of self.

NOTE: For bad primes, this is only implemented when the group if Gamma0 and p exactly divides the level.

NOTE: the input abelian variety must be simple

ALGORITHM: See "Component Groups of Quotients of J0(N)" by Kohel and Stein. That paper is about optimal quotients; however, section 4.1 of Conrad-Stein "Component Groups of Purely Toric Quotients", one sees that the component group of an optimal quotient is the same as the component group of its dual (which is the subvariety).

INPUT: • p – a prime number

OUTPUT: • Integer

EXAMPLES:

```
sage: A = J0(37)[1]
sage: A.component_group_order(37)
3
sage: A = J0(43)[1]
sage: A.component_group_order(37)
1
sage: A.component_group_order(43)
7
sage: A = J0(23)[0]
sage: A.component_group_order(23)
11
```

tamagawa_number(*p*)

Return the Tamagawa number of this abelian variety at p.

NOTE: For bad primes, this is only implemented when the group if Gamma0 and p exactly divides the level and Atkin-Lehner acts diagonally on this abelian variety (e.g., if this variety is new and simple). See the self.component_group command for more information.

NOTE: the input abelian variety must be simple

In cases where this function doesn't work, consider using the self.tamagawa_number_bounds functions.

INPUT: • p – a prime number

OUTPUT: • Integer

EXAMPLES:

```
sage: A = J0(37)[1]
sage: A.tamagawa_number(37)
3
sage: A = J0(43)[1]
sage: A.tamagawa_number(37)
1
sage: A.tamagawa_number(43)
7
sage: A = J0(23)[0]
sage: A.tamagawa_number(23)
11
```

tamagawa_number_bounds(*p*)

Return a divisor and multiple of the Tamagawa number of self at p.

NOTE: the input abelian variety must be simple

INPUT: • p – a prime number

OUTPUT: • div – integer; divisor of Tamagawa number at p
- mul – integer; multiple of Tamagawa number at p
- mul_primes – tuple; in case mul==0, a list of all primes that can possibly divide the Tamagawa number at p.

EXAMPLES:

```
sage: A = J0(63).new_subvariety()[1]; A
Simple abelian subvariety 63b(1,63) of dimension 2 of J0(63)
sage: A.tamagawa_number_bounds(7)
(3, 3, ())
sage: A.tamagawa_number_bounds(3)
(1, 0, (2, 3, 5))
```

class ModularAbelianVariety_modsym_abstract(*groups, base_field, is_simple=None, newform_level=None, isogeny_number=None, number=None, check=True*)

decomposition(*simple=True, bound=None*)

Decompose this modular abelian variety as a product of abelian subvarieties, up to isogeny.

INPUT: simple- bool (default: True) if True, all factors are simple. If False, each factor returned is isogenous to a power of a simple and the simples in each factor are distinct.

•`bound` - int (default: None) if given, only use Hecke operators up to this bound when decomposing. This can give wrong answers, so use with caution!

EXAMPLES:

```
sage: J = J0(33)
sage: J.decomposition()
[
Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33),
Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33),
Simple abelian subvariety 33a(1,33) of dimension 1 of J0(33)
]
sage: J1(17).decomposition()
[
Simple abelian subvariety 17aG1(1,17) of dimension 1 of J1(17),
Simple abelian subvariety 17bG1(1,17) of dimension 4 of J1(17)
]
```

dimension()

Return the dimension of this modular abelian variety.

EXAMPLES:

```
sage: J0(37)[0].dimension()
1
sage: J0(43)[1].dimension()
2
sage: J1(17)[1].dimension()
4
```

group()

Return the congruence subgroup associated that this modular abelian variety is associated to.

EXAMPLES:

```
sage: J0(13).group()
Congruence Subgroup Gamma0(13)
```

```
sage: J1(997).group()
Congruence Subgroup Gamma1(997)
sage: JH(37,[3]).group()
Congruence Subgroup Gamma_H(37) with H generated by [3]
sage: J0(37)[1].groups()
(Congruence Subgroup Gamma0(37),)
```

groups()

Return the tuple of groups associated to the modular symbols abelian variety. This is always a 1-tuple.

OUTPUT: tuple

EXAMPLES:

```
sage: A = ModularSymbols(33).cuspidal_submodule().abelian_variety(); A
Abelian variety J0(33) of dimension 3
sage: A.groups()
(Congruence Subgroup Gamma0(33),)
sage: type(A)
<class 'sage.modular.abvar.abvar.ModularAbelianVariety_modsym'>
```

is_ambient()

Return True if this abelian variety attached to a modular symbols space space is attached to the cuspidal subspace of the ambient modular symbols space.

OUTPUT: bool

EXAMPLES:

```
sage: A = ModularSymbols(43).cuspidal_subspace().abelian_variety(); A
Abelian variety J0(43) of dimension 3
sage: A.is_ambient()
True
sage: type(A)
<class 'sage.modular.abvar.abvar.ModularAbelianVariety_modsym'>
sage: A = ModularSymbols(43).cuspidal_subspace()[1].abelian_variety(); A
Abelian subvariety of dimension 2 of J0(43)
sage: A.is_ambient()
False
```

is_subvariety(*other*)

Return True if self is a subvariety of other.

EXAMPLES:

```
sage: J = J0(37); J
Abelian variety J0(37) of dimension 2
sage: A = J[0]; A
Simple abelian subvariety 37a(1,37) of dimension 1 of J0(37)
sage: A.is_subvariety(J)
True
sage: A.is_subvariety(J0(11))
False
```

There may be a way to map A into $J_0(74)$, but A is not equipped with any special structure of an embedding.

```
sage: A.is_subvariety(J0(74))
False
```

Some ambient examples:

```
sage: J = J0(37)
sage: J.is_subvariety(J)
```

```
True
sage: J.is_subvariety(25)
False
```

More examples:

```
sage: A = J0(42); D = A.decomposition(); D
[
Simple abelian subvariety 14a(1,42) of dimension 1 of J0(42),
Simple abelian subvariety 14a(3,42) of dimension 1 of J0(42),
Simple abelian subvariety 21a(1,42) of dimension 1 of J0(42),
Simple abelian subvariety 21a(2,42) of dimension 1 of J0(42),
Simple abelian subvariety 42a(1,42) of dimension 1 of J0(42)
]
sage: D[0].is_subvariety(A)
True
sage: D[1].is_subvariety(D[0] + D[1])
True
sage: D[2].is_subvariety(D[0] + D[1])
False
```

lattice()

Return the lattice the defines this modular symbols modular abelian variety.

OUTPUT: a free $\mathbf{Z}$-module embedded in an ambient $\mathbf{Q}$-vector space

EXAMPLES:

```
sage: A = ModularSymbols(33).cuspidal_submodule()[0].abelian_variety(); A
Abelian subvariety of dimension 1 of J0(33)
sage: A.lattice()
Free module of degree 6 and rank 2 over Integer Ring
User basis matrix:
[ 1  0  0 -1  0  0]
[ 0  0  1  0  1 -1]
sage: type(A)
<class 'sage.modular.abvar.abvar.ModularAbelianVariety_modsym'>
```

modular_symbols(*sign=0*)

Return space of modular symbols (with given sign) associated to this modular abelian variety, if it can be found by cutting down using Hecke operators. Otherwise raise a RuntimeError exception.

EXAMPLES:

```
sage: A = J0(37)
sage: A.modular_symbols()
Modular Symbols subspace of dimension 4 of Modular Symbols space of dimension 5 for Gamma_0(
sage: A.modular_symbols(1)
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 3 for Gamma_0(
```

More examples:

```
sage: J0(11).modular_symbols()
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 3 for Gamma_0(
sage: J0(11).modular_symbols(sign=1)
Modular Symbols subspace of dimension 1 of Modular Symbols space of dimension 2 for Gamma_0(
sage: J0(11).modular_symbols(sign=0)
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 3 for Gamma_0(
sage: J0(11).modular_symbols(sign=-1)
Modular Symbols space of dimension 1 for Gamma_0(11) of weight 2 with sign -1 over Rational
```

Even more examples:

```
sage: A = J0(33)[1]; A
Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33)
sage: A.modular_symbols()
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 9 for Gamma_0(
```

It is not always possible to determine the sign subspaces:

```
sage: A.modular_symbols(1)
...
RuntimeError: unable to determine sign (=1) space of modular symbols

sage: A.modular_symbols(-1)
...
RuntimeError: unable to determine sign (=-1) space of modular symbols
```

new_subvariety(*p=None*)

Return the new or p-new subvariety of self.

INPUT:

- `self` - a modular abelian variety
- `p` - prime number or None (default); if p is a prime, return the p-new subvariety. Otherwise return the full new subvariety.

EXAMPLES:

```
sage: J0(33).new_subvariety()
Abelian subvariety of dimension 1 of J0(33)
sage: J0(100).new_subvariety()
Abelian subvariety of dimension 1 of J0(100)
sage: J1(13).new_subvariety()
Abelian variety J1(13) of dimension 2
```

old_subvariety(*p=None*)

Return the old or p-old abelian variety of self.

INPUT:

- `self` - a modular abelian variety
- `p` - prime number or None (default); if p is a prime, return the p-old subvariety. Otherwise return the full old subvariety.

EXAMPLES:

```
sage: J0(33).old_subvariety()
Abelian subvariety of dimension 2 of J0(33)
sage: J0(100).old_subvariety()
Abelian subvariety of dimension 6 of J0(100)
sage: J1(13).old_subvariety()
Abelian subvariety of dimension 0 of J1(13)
```

factor_modsym_space_new_factors(*M*)

Given an ambient modular symbols space, return complete factorization of it.

INPUT:

- `M` - modular symbols space

OUTPUT: list of decompositions corresponding to each new space.

EXAMPLES:

```
sage: M = ModularSymbols(33)
sage: sage.modular.abvar.abvar.factor_modsym_space_new_factors(M)
[[
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 3 for Gamma_0(11)
],
 [
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 9 for Gamma_0(33)
]]
```

factor_new_space(*M*)

Given a new space M of modular symbols, return the decomposition into simple of M under the Hecke operators.

INPUT:

- M - modular symbols space

OUTPUT: list of factors

EXAMPLES:

```
sage: M = ModularSymbols(37).cuspidal_subspace()
sage: sage.modular.abvar.abvar.factor_new_space(M)
[
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 5 for Gamma_0(37)
Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 5 for Gamma_0(37)
]
```

is_ModularAbelianVariety(*x*)

Return True if x is a modular abelian variety.

INPUT:

- x - object

EXAMPLES:

```
sage: from sage.modular.abvar.abvar import is_ModularAbelianVariety
sage: is_ModularAbelianVariety(5)
False
sage: is_ModularAbelianVariety(J0(37))
True
```

Returning True is a statement about the data type not whether or not some abelian variety is modular:

```
sage: is_ModularAbelianVariety(EllipticCurve('37a'))
False
```

modsym_lattices(*M, factors*)

Append lattice information to the output of simple_factorization_of_modsym_space.

INPUT:

- M - modular symbols spaces
- factors - Sequence (simple_factorization_of_modsym_space)

OUTPUT: sequence with more information for each factor (the lattice)

EXAMPLES:

```
sage: M = ModularSymbols(33)
sage: factors = sage.modular.abvar.abvar.simple_factorization_of_modsym_space(M, simple=False)
sage: sage.modular.abvar.abvar.modsym_lattices(M, factors)
[
(11, 0, None, Modular Symbols subspace of dimension 4 of Modular Symbols space of dimension 9 fo
Echelon basis matrix:
[ 1  0  0  0 -1  2]
[ 0  1  0  0 -1  1]
[ 0  0  1  0 -2  2]
[ 0  0  0  1 -1 -1]),
(33, 0, None, Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 9 fo
Echelon basis matrix:
[ 1  0  0 -1  0  0]
[ 0  0  1  0  1 -1])
]
```

random_hecke_operator(*M, t=None, p=2*)

Return a random Hecke operator acting on M, got by adding to t a random multiple of T_p

INPUT:

- `M` - modular symbols space
- `t` - None or a Hecke operator
- `p` - a prime

OUTPUT: Hecke operator prime

EXAMPLES:

```
sage: M = ModularSymbols(11).cuspidal_subspace()
sage: t, p = sage.modular.abvar.abvar.random_hecke_operator(M)
sage: p
3
sage: t, p = sage.modular.abvar.abvar.random_hecke_operator(M, t, p)
sage: p
5
```

simple_factorization_of_modsym_space(*M, simple=True*)

Return factorization of M. If simple is False, return powers of simples.

INPUT:

- `M` - modular symbols space
- `simple` - bool (default: True)

OUTPUT: sequence

EXAMPLES:

```
sage: M = ModularSymbols(33)
sage: sage.modular.abvar.abvar.simple_factorization_of_modsym_space(M)
[
(11, 0, 1, Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 9 for G
(11, 0, 3, Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 9 for G
(33, 0, 1, Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 9 for G
]
sage: sage.modular.abvar.abvar.simple_factorization_of_modsym_space(M, simple=False)
[
(11, 0, None, Modular Symbols subspace of dimension 4 of Modular Symbols space of dimension 9 fo
```

```
(33, 0, None, Modular Symbols subspace of dimension 2 of Modular Symbols space of dimension 9 fc
]
```

sqrt_poly(*f*)

Return the square root of the polynomial f.

Note: At some point something like this should be a member of the polynomial class. For now this is just used internally by some charpoly functions above.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: f = (x-1)*(x+2)*(x^2 + 1/3*x + 5)
sage: f
x^4 + 4/3*x^3 + 10/3*x^2 + 13/3*x - 10
sage: sage.modular.abvar.abvar.sqrt_poly(f^2)
x^4 + 4/3*x^3 + 10/3*x^2 + 13/3*x - 10
sage: sage.modular.abvar.abvar.sqrt_poly(f)
...
ValueError: f must be a perfect square
sage: sage.modular.abvar.abvar.sqrt_poly(2*f^2)
...
ValueError: f must be monic
```

46.3 Ambient Jacobian Abelian Variety

TESTS:

```
sage: loads(dumps(J0(37))) == J0(37)
True
sage: loads(dumps(J1(13))) == J1(13)
True
```

ModAbVar_ambient_jacobian(*group*)

Return the ambient Jacobian attached to a given congruence subgroup.

The result is cached using a weakref. This function is called internally by modular abelian variety constructors.

INPUT:

- `group` - a congruence subgroup.

OUTPUT: a modular abelian variety attached

EXAMPLES:

```
sage: import sage.modular.abvar.abvar_ambient_jacobian as abvar_ambient_jacobian
sage: A = abvar_ambient_jacobian.ModAbVar_ambient_jacobian(Gamma0(11))
sage: A
Abelian variety J0(11) of dimension 1
sage: B = abvar_ambient_jacobian.ModAbVar_ambient_jacobian(Gamma0(11))
sage: A is B
True
```

You can get access to and/or clear the cache as follows:

```
sage: abvar_ambient_jacobian._cache = {}
sage: B = abvar_ambient_jacobian.ModAbVar_ambient_jacobian(Gamma0(11))
sage: A is B
False
```

class **ModAbVar_ambient_jacobian_class**(*group*)

An ambient Jacobian modular abelian variety attached to a congruence subgroup.

ambient_variety()

Return the ambient modular abelian variety that contains self. Since self is a Jacobian modular abelian variety, this is just self.

OUTPUT: abelian variety

EXAMPLES:

```
sage: A = J0(17)
sage: A.ambient_variety()
Abelian variety J0(17) of dimension 1
sage: A is A.ambient_variety()
True
```

decomposition(*simple=True, bound=None*)

Decompose this ambient Jacobian as a product of abelian subvarieties, up to isogeny.

EXAMPLES:

```
sage: J0(33).decomposition(simple=False)
[
Abelian subvariety of dimension 2 of J0(33),
Abelian subvariety of dimension 1 of J0(33)
]
sage: J0(33).decomposition(simple=False)[1].is_simple()
True
sage: J0(33).decomposition(simple=False)[0].is_simple()
False
sage: J0(33).decomposition(simple=False)
[
Abelian subvariety of dimension 2 of J0(33),
Simple abelian subvariety 33a(None,33) of dimension 1 of J0(33)
]
sage: J0(33).decomposition(simple=True)
[
Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33),
Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33),
Simple abelian subvariety 33a(1,33) of dimension 1 of J0(33)
]
```

degeneracy_map(*level, t=1, check=True*)

Return the t-th degeneracy map from self to J(level). Here t must be a divisor of either level/self.level() or self.level()/level.

INPUT:

- `level` - integer (multiple or divisor of level of self)
- `t` - divisor of quotient of level of self and level
- `check` - bool (default: True); if True do some checks on the input

OUTPUT: a morphism

EXAMPLES:

```
sage: J0(11).degeneracy_map(33)
Degeneracy map from Abelian variety J0(11) of dimension 1 to Abelian variety J0(33) of dimen
sage: J0(11).degeneracy_map(33).matrix()
[ 0 -3  2  1 -2  0]
[ 1 -2  0  1  0 -1]
sage: J0(11).degeneracy_map(33,3).matrix()
[-1  0  0  0  1 -2]
[-1 -1  1 -1  1  0]
sage: J0(33).degeneracy_map(11,1).matrix()
[ 0  1]
[ 0 -1]
[ 1 -1]
[ 0  1]
[-1  1]
[ 0  0]
sage: J0(11).degeneracy_map(33,1).matrix() * J0(33).degeneracy_map(11,1).matrix()
[4 0]
[0 4]
```

dimension()

Return the dimension of this modular abelian variety.

EXAMPLES:

```
sage: J0(2007).dimension()
221
sage: J1(13).dimension()
2
sage: J1(997).dimension()
40920
sage: J0(389).dimension()
32
sage: JH(389,[4]).dimension()
64
sage: J1(389).dimension()
6112
```

group()

Return the group that this Jacobian modular abelian variety is attached to.

EXAMPLES:

```
sage: J1(37).group()
Congruence Subgroup Gamma1(37)
sage: J0(5077).group()
Congruence Subgroup Gamma0(5077)
sage: J = GammaH(11,[3]).modular_abelian_variety(); J
Abelian variety JH(11,[3]) of dimension 1
sage: J.group()
Congruence Subgroup Gamma_H(11) with H generated by [3]
```

groups()

Return the tuple of congruence subgroups attached to this ambient Jacobian. This is always a tuple of length 1.

OUTPUT: tuple

EXAMPLES:

```
sage: J0(37).groups()
(Congruence Subgroup Gamma0(37),)
```

46.4 Finite subgroups of modular abelian varieties

Sage can compute with fairly general finite subgroups of modular abelian varieties. Elements of finite order are represented by equivalence classes of elements in $H_1(A, \mathbf{Q})$ modulo $H_1(A, \mathbf{Z})$. A finite subgroup can be defined by giving generators and via various other constructions. Given a finite subgroup, one can compute generators, as well as the structure as an abstract group. Arithmetic on subgroups is also supported, including adding two subgroups together, checking inclusion, etc.

TODO: Intersection, action of Hecke operators.

AUTHORS:

- William Stein (2007-03)

EXAMPLES:

```
sage: J = J0(33)
sage: C = J.cuspidal_subgroup()
sage: C
Finite subgroup with invariants [10, 10] over QQ of Abelian variety J0(33) of dimension 3
sage: C.order()
100
sage: C.gens()
[[(1/10, 0, 1/10, 1/10, 1/10, 3/10)], [(0, 1/5, 1/10, 0, 1/10, 9/10)], [(0, 0, 1/2, 0, 1/2, 1/2)]]
sage: C.0 + C.1
[(1/10, 1/5, 1/5, 1/10, 1/5, 6/5)]
sage: 10*(C.0 + C.1)
[(0, 0, 0, 0, 0, 0)]
sage: G = C.subgroup([C.0 + C.1]); G
Finite subgroup with invariants [10] over QQbar of Abelian variety J0(33) of dimension 3
sage: G.gens()
[[(1/10, 1/5, 1/5, 1/10, 1/5, 1/5)]]
sage: G.order()
10
sage: G <= C
True
sage: G >= C
False
```

We make a table of the order of the cuspidal subgroup for the first few levels:

```
sage: for N in range(11,40): print N, J0(N).cuspidal_subgroup().order()
...
11 5
12 1
13 1
14 6
15 8
16 1
17 4
18 1
19 3
20 6
21 8
22 25
23 11
24 8
```

```
25 1
26 21
27 9
28 36
29 7
30 192
31 5
32 8
33 100
34 48
35 48
36 12
37 3
38 135
39 56
```

TESTS:

```
sage: G = J0(11).finite_subgroup([[1/3,0], [0,1/5]]); G
Finite subgroup with invariants [15] over QQbar of Abelian variety J0(11) of dimension 1
sage: loads(dumps(G)) == G
True
sage: loads(dumps(G.0)) == G.0
True
```

class FiniteSubgroup(*abvar, field_of_definition=Rational Field*)

abelian_variety()

Return the abelian variety that this is a finite subgroup of.

EXAMPLES:

```
sage: J = J0(42)
sage: G = J.rational_torsion_subgroup(); G
Torsion subgroup of Abelian variety J0(42) of dimension 5
sage: G.abelian_variety()
Abelian variety J0(42) of dimension 5
```

exponent()

Return the exponent of this finite abelian group.

OUTPUT: Integer

EXAMPLES:

```
sage: t = J0(33).hecke_operator(7)
sage: G = t.kernel()[0]; G
Finite subgroup with invariants [2, 2, 2, 2, 4, 4] over QQ of Abelian variety J0(33) of dime
sage: G.exponent()
4
```

field_of_definition()

Return the field over which this finite modular abelian variety subgroup is defined. This is a field over which this subgroup is defined.

EXAMPLES:

```
sage: J = J0(42)
sage: G = J.rational_torsion_subgroup(); G
Torsion subgroup of Abelian variety J0(42) of dimension 5
```

```
sage: G.field_of_definition()
Rational Field
```

gen(*n*)

Return n^{th} generator of self.

EXAMPLES:

```
sage: J = J0(23)
sage: C = J.torsion_subgroup(3)
sage: C.gens()
[[(1/3, 0, 0, 0)], [(0, 1/3, 0, 0)], [(0, 0, 1/3, 0)], [(0, 0, 0, 1/3)]]
sage: C.gen(0)
[(1/3, 0, 0, 0)]
sage: C.gen(3)
[(0, 0, 0, 1/3)]
sage: C.gen(4)
...
IndexError: list index out of range
```

Negative indices wrap around:

```
sage: C.gen(-1)
[(0, 0, 0, 1/3)]
```

gens()

Return generators for this finite subgroup.

EXAMPLES: We list generators for several cuspidal subgroups:

```
sage: J0(11).cuspidal_subgroup().gens()
[[(0, 1/5)]]
sage: J0(37).cuspidal_subgroup().gens()
[[(0, 0, 0, 1/3)]]
sage: J0(43).cuspidal_subgroup().gens()
[[(0, 1/7, 0, 6/7, 0, 5/7)]]
sage: J1(13).cuspidal_subgroup().gens()
[[(1/19, 0, 0, 9/19)], [(0, 1/19, 1/19, 18/19)]]
sage: J0(22).torsion_subgroup(6).gens()
[[(1/6, 0, 0, 0)], [(0, 1/6, 0, 0)], [(0, 0, 1/6, 0)], [(0, 0, 0, 1/6)]]
```

intersection(*other*)

Return the intersection of the finite subgroups self and other.

INPUT:

- `other` - a finite group

OUTPUT: a finite group

EXAMPLES:

```
sage: E11a0, E11a1, B = J0(33)
sage: G = E11a0.torsion_subgroup(6); H = E11a0.torsion_subgroup(9)
sage: G.intersection(H)
Finite subgroup with invariants [3, 3] over QQ of Simple abelian subvariety 11a(1,33) of dim
sage: W = E11a1.torsion_subgroup(15)
sage: G.intersection(W)
Finite subgroup with invariants [] over QQ of Simple abelian subvariety 11a(1,33) of dimensi
sage: E11a0.intersection(E11a1)[0]
Finite subgroup with invariants [5] over QQ of Simple abelian subvariety 11a(1,33) of dimens
```

We intersect subgroups of different abelian varieties.

```
sage: E11a0, E11a1, B = J0(33)
sage: G = E11a0.torsion_subgroup(5); H = E11a1.torsion_subgroup(5)
sage: G.intersection(H)
Finite subgroup with invariants [5] over QQ of Simple abelian subvariety 11a(1,33) of dimens
sage: E11a0.intersection(E11a1)[0]
Finite subgroup with invariants [5] over QQ of Simple abelian subvariety 11a(1,33) of dimens
```

We intersect abelian varieties with subgroups:

```
sage: t = J0(33).hecke_operator(7)
sage: G = t.kernel()[0]; G
Finite subgroup with invariants [2, 2, 2, 2, 4, 4] over QQ of Abelian variety J0(33) of dime
sage: A = J0(33).old_subvariety()
sage: A.intersection(G)
Finite subgroup with invariants [2, 2, 2, 2] over QQ of Abelian subvariety of dimension 2 of
sage: A.hecke_operator(7).kernel()[0]
Finite subgroup with invariants [2, 2, 2, 2] over QQ of Abelian subvariety of dimension 2 of
sage: B = J0(33).new_subvariety()
sage: B.intersection(G)
Finite subgroup with invariants [4, 4] over QQ of Abelian subvariety of dimension 1 of J0(33
sage: B.hecke_operator(7).kernel()[0]
Finite subgroup with invariants [4, 4] over QQ of Abelian subvariety of dimension 1 of J0(33
sage: A.intersection(B)[0]
Finite subgroup with invariants [3, 3] over QQ of Abelian subvariety of dimension 2 of J0(33
```

invariants()

Return elementary invariants of this abelian group, by which we mean a nondecreasing (immutable) sequence of integers n_i, $1 \leq i \leq k$, with n_i dividing n_{i+1}, and such that this group is abstractly isomorphic to $\mathbf{Z}/n_1\mathbf{Z} \times \cdots \times \mathbf{Z}/n_k\mathbf{Z}$.

EXAMPLES:

```
sage: J = J0(38)
sage: C = J.cuspidal_subgroup(); C
Finite subgroup with invariants [3, 45] over QQ of Abelian variety J0(38) of dimension 4
sage: v = C.invariants(); v
[3, 45]
sage: v[0] = 5
...
ValueError: object is immutable; please change a copy instead.
sage: type(v[0])
<type 'sage.rings.integer.Integer'>

sage: C * 3
Finite subgroup with invariants [15] over QQ of Abelian variety J0(38) of dimension 4
```

An example involving another cuspidal subgroup:

```
sage: C = J0(22).cuspidal_subgroup(); C
Finite subgroup with invariants [5, 5] over QQ of Abelian variety J0(22) of dimension 2
sage: C.lattice()
Free module of degree 4 and rank 4 over Integer Ring
Echelon basis matrix:
[1/5 1/5 4/5   0]
[  0   1   0   0]
[  0   0   1   0]
[  0   0   0 1/5]
sage: C.invariants()
[5, 5]
```

is_subgroup(*other*)

Return True exactly if self is a subgroup of other, and both are defined as subgroups of the same ambient abelian variety.

EXAMPLES:

```
sage: C = J0(22).cuspidal_subgroup()
sage: H = C.subgroup([C.0])
sage: K = C.subgroup([C.1])
sage: H.is_subgroup(K)
False
sage: K.is_subgroup(H)
False
sage: K.is_subgroup(C)
True
sage: H.is_subgroup(C)
True
```

lattice()

Return the lattice corresponding to this subgroup in the rational homology of the modular Jacobian product. The elements of the subgroup are represented by vectors in the ambient vector space (the rational homology), and this returns the lattice they span. EXAMPLES:

```
sage: J = J0(33); C = J[0].cuspidal_subgroup(); C
Finite subgroup with invariants [5] over QQ of Simple abelian subvariety 11a(1,33) of dimens
sage: C.lattice()
Free module of degree 6 and rank 2 over Integer Ring
Echelon basis matrix:
[ 1/5 13/5   -2 -4/5    2 -1/5]
[   0    3   -2   -1    2    0]
```

order()

Return the order (number of elements) of this finite subgroup.

EXAMPLES:

```
sage: J = J0(42)
sage: C = J.cuspidal_subgroup()
sage: C.order()
2304
```

subgroup(*gens*)

Return the subgroup of self spanned by the given generators, which all must be elements of self.

EXAMPLES:

```
sage: J = J0(23)
sage: G = J.torsion_subgroup(11); G
Finite subgroup with invariants [11, 11, 11, 11] over QQ of Abelian variety J0(23) of dimens
```

We create the subgroup of the 11-torsion subgroup of $J_0(23)$ generated by the first 11-torsion point:

```
sage: H = G.subgroup([G.0]); H
Finite subgroup with invariants [11] over QQbar of Abelian variety J0(23) of dimension 2
sage: H.invariants()
[11]
```

We can also create a subgroup from a list of objects that coerce into the ambient rational homology.

```
sage: H == G.subgroup([[1/11,0,0,0]])
True
```

class FiniteSubgroup_lattice(*abvar, lattice, field_of_definition=Algebraic Field, check=True*)

lattice()
Return lattice that defines this finite subgroup.
EXAMPLES:

```
sage: J = J0(11)
sage: G = J.finite_subgroup([[1/3,0], [0,1/5]]); G
Finite subgroup with invariants [15] over QQbar of Abelian variety J0(11) of dimension 1
sage: G.lattice()
Free module of degree 2 and rank 2 over Integer Ring
Echelon basis matrix:
[1/3   0]
[  0 1/5]
```

class TorsionPoint (*parent, element, check=True*)

additive_order()
Return the additive order of this element.
EXAMPLES:

```
sage: J = J0(11); G = J.finite_subgroup([[1/3,0], [0,1/5]])
sage: G.0.additive_order()
3
sage: G.1.additive_order()
5
sage: (G.0 + G.1).additive_order()
15
sage: (3*G.0).additive_order()
1
```

element()
Return an underlying QQ-vector space element that defines this element of a modular abelian variety. This is a vector in the ambient Jacobian variety's rational homology.
EXAMPLES: We create some elements of $J_0(11)$:

```
sage: J = J0(11)
sage: G = J.finite_subgroup([[1/3,0], [0,1/5]]); G
Finite subgroup with invariants [15] over QQbar of Abelian variety J0(11) of dimension 1
sage: G.0.element()
(1/3, 0)
```

The underlying element is a vector over the rational numbers:

```
sage: v = (G.0-G.1).element(); v
(1/3, -1/5)
sage: type(v)
<type 'sage.modules.vector_rational_dense.Vector_rational_dense'>
```

46.5 Torsion subgroups of modular abelian varieties.

Sage can compute information about the structure of the torsion subgroup of a modular abelian variety. Sage computes a multiple of the order by computing the greatest common divisor of the orders of the torsion subgroup of the reduction of the abelian variety modulo p for various primes p. Sage computes a divisor of the order by computing the rational cuspidal subgroup. When these two bounds agree (which is often the case), we determine the exact structure of the torsion subgroup.

AUTHORS:

- William Stein (2007-03)

EXAMPLES: First we consider $J_0(50)$ where everything works out nicely:

```
sage: J = J0(50)
sage: T = J.rational_torsion_subgroup(); T
Torsion subgroup of Abelian variety J0(50) of dimension 2
sage: T.multiple_of_order()
15
sage: T.divisor_of_order()
15
sage: T.gens()
[[(1/15, 3/5, 2/5, 14/15)]]
sage: T.invariants()
[15]
sage: d = J.decomposition(); d
[
Simple abelian subvariety 50a(1,50) of dimension 1 of J0(50),
Simple abelian subvariety 50b(1,50) of dimension 1 of J0(50)
]
sage: d[0].rational_torsion_subgroup().order()
3
sage: d[1].rational_torsion_subgroup().order()
5
```

Next we make a table of the upper and lower bounds for each new factor.

```
sage: for N in range(1,38):
...     for A in J0(N).new_subvariety().decomposition():
...         T = A.rational_torsion_subgroup()
...         print '%-5s%-5s%-5s%-5s'%(N, A.dimension(), T.divisor_of_order(), T.multiple_of_order())
11   1    5    5
14   1    6    6
15   1    8    8
17   1    4    4
19   1    3    3
20   1    6    6
21   1    8    8
23   2    11   11
24   1    8    8
26   1    3    3
26   1    7    7
27   1    3    3
29   2    7    7
30   1    6    12
31   2    5    5
32   1    4    4
33   1    4    4
34   1    6    6
35   1    3    3
35   2    16   16
36   1    6    6
37   1    1    1
37   1    3    3
```

TESTS:

```
sage: T = J0(54).rational_torsion_subgroup()
sage: loads(dumps(T)) == T
True
```

class QQbarTorsionSubgroup(*abvar*)

abelian_variety()

Return the abelian variety that this is the set of all torsion points on.

OUTPUT: abelian variety

EXAMPLES:

```
sage: J0(23).qbar_torsion_subgroup().abelian_variety()
Abelian variety J0(23) of dimension 2
```

field_of_definition()

Return the field of definition of this subgroup. Since this is the group of all torsion it is defined over the base field of this abelian variety.

OUTPUT: a field

EXAMPLES:

```
sage: J0(23).qbar_torsion_subgroup().field_of_definition()
Rational Field
```

class RationalTorsionSubgroup(*abvar*)

The torsion subgroup of a modular abelian variety.

divisor_of_order()

Return a divisor of the order of this torsion subgroup of a modular abelian variety.

EXAMPLES:

```
sage: t = J0(37)[1].rational_torsion_subgroup()
sage: t.divisor_of_order()
3
```

lattice()

Return lattice that defines this torsion subgroup, if possible.

Warning: There is no known algorithm in general to compute the rational torsion subgroup. Use rational_cusp_group to obtain a subgroup of the rational torsion subgroup in general.

EXAMPLES:

```
sage: J0(11).rational_torsion_subgroup().lattice()
Free module of degree 2 and rank 2 over Integer Ring
Echelon basis matrix:
[  1   0]
[  0 1/5]
```

The following fails because in fact I know of no (reasonable) algorithm to provably compute the torsion subgroup in general.

```
sage: T = J0(33).rational_torsion_subgroup()
sage: T.lattice()
...
NotImplementedError: unable to compute the rational torsion subgroup in this case (there is
```

The problem is that the multiple of the order obtained by counting points over finite fields is twice the divisor of the order got from the rational cuspidal subgroup.

```
sage: T.multiple_of_order(30)
200
sage: J0(33).rational_cusp_subgroup().order()
100
```

multiple_of_order(*maxp=None*)

Return a multiple of the order of this torsion group.

The multiple is computed using characteristic polynomials of Hecke operators of odd index not dividing the level.

INPUT:

- `maxp` - (default: None) If maxp is None (the default), return gcd of best bound computed so far with bound obtained by computing GCD's of orders modulo p until this gcd stabilizes for 3 successive primes. If maxp is given, just use all primes up to and including maxp.

EXAMPLES:

```
sage: J = J0(11)
sage: G = J.rational_torsion_subgroup()
sage: G.multiple_of_order(11)
5
sage: J = J0(389)
sage: G = J.rational_torsion_subgroup(); G
Torsion subgroup of Abelian variety J0(389) of dimension 32
sage: G.multiple_of_order()
97
sage: [G.multiple_of_order(p) for p in prime_range(3,11)]
[92645296242160800, 7275, 291]
sage: [G.multiple_of_order(p) for p in prime_range(3,13)]
[92645296242160800, 7275, 291, 97]
sage: [G.multiple_of_order(p) for p in prime_range(3,19)]
[92645296242160800, 7275, 291, 97, 97, 97]

sage: J = J0(33) * J0(11) ; J.rational_torsion_subgroup().order()
...
NotImplementedError: torsion multiple only implemented for Gamma0
```

The next example illustrates calling this function with a larger input and how the result may be cached when maxp is None:

```
sage: T = J0(43)[1].rational_torsion_subgroup()
sage: T.multiple_of_order()
14
sage: T.multiple_of_order(50)
7
sage: T.multiple_of_order()
7
```

order()

Return the order of the torsion subgroup of this modular abelian variety.

This may fail if the multiple obtained by counting points modulo p exceeds the divisor obtained from the rational cuspidal subgroup.

EXAMPLES:

```
sage: a = J0(11)
sage: a.rational_torsion_subgroup().order()
5
sage: a = J0(23)
sage: a.rational_torsion_subgroup().order()
```

```
11
sage: t = J0(37)[1].rational_torsion_subgroup()
sage: t.order()
3
```

possible_orders()

Return the possible orders of this torsion subgroup, computed from a known divisor and multiple of the order.

EXAMPLES:

```
sage: J0(11).rational_torsion_subgroup().possible_orders()
[5]
sage: J0(33).rational_torsion_subgroup().possible_orders()
[100, 200]
```

Note that this function has not been implemented for $J_1(N)$, though it should be reasonably easy to do so soon (see Conrad, Edixhoven, Stein):

```
sage: J1(13).rational_torsion_subgroup().possible_orders()
...
NotImplementedError: torsion multiple only implemented for Gamma0
```

46.6 Cuspidal subgroups of modular abelian varieties

AUTHORS:

- William Stein (2007-03, 2008-02)

EXAMPLES: We compute the cuspidal subgroup of $J_1(13)$:

```
sage: A = J1(13)
sage: C = A.cuspidal_subgroup(); C
Finite subgroup with invariants [19, 19] over QQ of Abelian variety J1(13) of dimension 2
sage: C.gens()
[[(1/19, 0, 0, 9/19)], [(0, 1/19, 1/19, 18/19)]]
sage: C.order()
361
sage: C.invariants()
[19, 19]
```

We compute the cuspidal subgroup of $J_0(54)$:

```
sage: A = J0(54)
sage: C = A.cuspidal_subgroup(); C
Finite subgroup with invariants [3, 3, 3, 3, 3, 9] over QQ of Abelian variety J0(54) of dimension 4
sage: C.gens()
[[(1/3, 0, 0, 0, 0, 1/3, 0, 2/3)], [(0, 1/3, 0, 0, 0, 2/3, 0, 1/3)], [(0, 0, 1/9, 1/9, 1/9, 1/9, 1/9,
sage: C.order()
2187
sage: C.invariants()
[3, 3, 3, 3, 3, 9]
```

We compute the subgroup of the cuspidal subgroup generated by rational cusps.

```
sage: C = J0(54).rational_cusp_subgroup(); C
Finite subgroup with invariants [3, 3, 9] over QQ of Abelian variety J0(54) of dimension 4
sage: C.gens()
[[(1/3, 0, 0, 1/3, 2/3, 1/3, 0, 1/3)], [(0, 0, 1/9, 1/9, 7/9, 7/9, 1/9, 8/9)], [(0, 0, 0, 0, 0, 0, 1/
sage: C.order()
81
sage: C.invariants()
[3, 3, 9]
```

This might not give us the exact rational torsion subgroup, since it might be bigger than order 81:

```
sage: J0(54).rational_torsion_subgroup().multiple_of_order()
243
```

TESTS:

```
sage: C = J0(54).cuspidal_subgroup()
sage: loads(dumps(C)) == C
True
sage: D = J0(54).rational_cusp_subgroup()
sage: loads(dumps(D)) == D
True
```

class CuspidalSubgroup(*abvar, field_of_definition=Rational Field*)

EXAMPLES:

```
sage: a = J0(65)[2]
sage: t = a.cuspidal_subgroup()
sage: t.order()
6
```

lattice()

Returned cached tuple of vectors that define elements of the rational homology that generate this finite subgroup.

OUTPUT:

- `tuple` - cached

EXAMPLES:

```
sage: J = J0(27)
sage: G = J.cuspidal_subgroup()
sage: G.lattice()
Free module of degree 2 and rank 2 over Integer Ring
Echelon basis matrix:
[1/3   0]
[  0 1/3]
```

Test that the result is cached:

```
sage: G.lattice() is G.lattice()
True
```

class CuspidalSubgroup_generic(*abvar, field_of_definition=Rational Field*)

class RationalCuspidalSubgroup(*abvar, field_of_definition=Rational Field*)

EXAMPLES:

```
sage: a = J0(65)[2]
sage: t = a.rational_cusp_subgroup()
sage: t.order()
6
```

lattice()

Return lattice that defines this group.

OUTPUT: lattice

EXAMPLES:

```
sage: G = J0(27).rational_cusp_subgroup()
sage: G.lattice()
Free module of degree 2 and rank 2 over Integer Ring
Echelon basis matrix:
[1/3   0]
[  0   1]
```

Test that the result is cached.

```
sage: G.lattice() is G.lattice()
True
```

is_rational_cusp_gamma0(*c, N, data*)

Return True if the rational number c is a rational cusp of level N. This uses remarks in Glenn Steven's Ph.D. thesis.

INPUT:

- `c` - a cusp
- `N` - a positive integer
- `data` - the list [n for n in range(2,N) if gcd(n,N) == 1], which is passed in as a parameter purely for efficiency reasons.

EXAMPLES:

```
sage: from sage.modular.abvar.cuspidal_subgroup import is_rational_cusp_gamma0
sage: N = 27
sage: data = [n for n in range(2,N) if gcd(n,N) == 1]
sage: is_rational_cusp_gamma0(Cusp(1/3), N, data)
False
sage: is_rational_cusp_gamma0(Cusp(1), N, data)
True
sage: is_rational_cusp_gamma0(Cusp(oo), N, data)
True
sage: is_rational_cusp_gamma0(Cusp(2/9), N, data)
False
```

46.7 Homology of modular abelian varieties.

Sage can compute with homology groups associated to modular abelian varieties with coefficients in any commutative ring. Supported operations include computing matrices and characteristic polynomials of Hecke operators, rank, and rational decomposition as a direct sum of factors (obtained by cutting out kernels of Hecke operators).

AUTHORS:

- William Stein (2007-03)

EXAMPLES:

```
sage: J = J0(43)
sage: H = J.integral_homology()
sage: H
Integral Homology of Abelian variety J0(43) of dimension 3
sage: H.hecke_matrix(19)
[ 0  0 -2  0  2  0]
[ 2 -4 -2  0  2  0]
[ 0  0 -2 -2  0  0]
[ 2  0 -2 -4  2 -2]
[ 0  2  0 -2 -2  0]
[ 0  2  0 -2  0  0]
sage: H.base_ring()
Integer Ring
sage: d = H.decomposition(); d
[
Submodule of rank 2 of Integral Homology of Abelian variety J0(43) of dimension 3,
Submodule of rank 4 of Integral Homology of Abelian variety J0(43) of dimension 3
]
sage: a = d[0]
sage: a.hecke_matrix(5)
[-4  0]
[ 0 -4]
sage: a.T(7)
Hecke operator T_7 on Submodule of rank 2 of Integral Homology of Abelian variety J0(43) of dimensio
```

class Homology (*base_ring, level, weight*)

A homology group of an abelian variety, equipped with a Hecke action.

hecke_polynomial (*n, var='x'*)

Return the n-th Hecke polynomial in the given variable.

INPUT:

- `n` - positive integer
- `var` - string (default: 'x') the variable name

OUTPUT: a polynomial over ZZ in the given variable

EXAMPLES:

```
sage: H = J0(43).integral_homology(); H
Integral Homology of Abelian variety J0(43) of dimension 3
sage: f = H.hecke_polynomial(3); f
x^6 + 4*x^5 - 16*x^3 - 12*x^2 + 16*x + 16
sage: parent(f)
Univariate Polynomial Ring in x over Integer Ring
sage: H.hecke_polynomial(3,'w')
w^6 + 4*w^5 - 16*w^3 - 12*w^2 + 16*w + 16
```

class Homology_abvar (*abvar, base*)

The homology of a modular abelian variety.

abelian_variety ()

Return the abelian variety that this is the homology of.

EXAMPLES:

```
sage: H = J0(48).homology()
sage: H.abelian_variety()
Abelian variety J0(48) of dimension 3
```

ambient_hecke_module()

Return the ambient Hecke module that this homology is contained in.

EXAMPLES:

```
sage: H = J0(48).homology(); H
Integral Homology of Abelian variety J0(48) of dimension 3
sage: H.ambient_hecke_module()
Integral Homology of Abelian variety J0(48) of dimension 3
```

free_module()

Return the underlying free module of this homology group.

EXAMPLES:

```
sage: H = J0(48).homology()
sage: H.free_module()
Ambient free module of rank 6 over the principal ideal domain Integer Ring
```

gen(n)

Return n^{th} generator of self.

This is not yet implemented!

EXAMPLES:

```
sage: H = J0(37).homology()
sage: H.gen(0)     # this will change
...
NotImplementedError: homology classes not yet implemented
```

gens()

Return generators of self.

This is not yet implemented!

EXAMPLES:

```
sage: H = J0(37).homology()
sage: H.gens()     # this will change
...
NotImplementedError: homology classes not yet implemented
```

hecke_bound()

Return bound on the number of Hecke operators needed to generate the Hecke algebra as a $\mathbf{Z}$-module acting on this space.

EXAMPLES:

```
sage: J0(48).homology().hecke_bound()
16
sage: J1(15).homology().hecke_bound()
32
```

hecke_matrix(n)

Return the matrix of the n-th Hecke operator acting on this homology group.

INPUT:

- n - a positive integer

OUTPUT: a matrix over the coefficient ring of this homology group

EXAMPLES:

```
sage: H = J0(23).integral_homology()
sage: H.hecke_matrix(3)
[-1 -2  2  0]
[ 0 -3  2 -2]
```

```
[ 2 -4  3 -2]
[ 2 -2  0  1]
```

The matrix is over the coefficient ring:

```
sage: J = J0(23)
sage: J.homology(QQ[I]).hecke_matrix(3).parent()
Full MatrixSpace of 4 by 4 dense matrices over Number Field in I with defining polynomial x^
```

rank()

Return the rank as a module or vector space of this homology group.

EXAMPLES:

```
sage: H = J0(5077).homology(); H
Integral Homology of Abelian variety J0(5077) of dimension 422
sage: H.rank()
844
```

submodule(*U, check=True*)

Return the submodule of this homology group given by U, which should be a submodule of the free module associated to this homology group.

INPUT:

- `U` - submodule of ambient free module (or something that defines one)
- `check` - currently ignored.

Note: We do *not* check that U is invariant under all Hecke operators.

EXAMPLES:

```
sage: H = J0(23).homology(); H
Integral Homology of Abelian variety J0(23) of dimension 2
sage: F = H.free_module()
sage: U = F.span([[1,2,3,4]])
sage: M = H.submodule(U); M
Submodule of rank 1 of Integral Homology of Abelian variety J0(23) of dimension 2
```

Note that the submodule command doesn't actually check that the object defined is a homology group or is invariant under the Hecke operators. For example, the fairly random M that we just defined is not invariant under the Hecke operators, so it is not a Hecke submodule - it is only a $\mathbf{Z}$-submodule.

```
sage: M.hecke_matrix(3)
...
ArithmeticError: subspace is not invariant under matrix
```

class **Homology_over_base**(*abvar, base_ring*)

The homology over a modular abelian variety over an arbitrary base commutative ring (not $\mathbf{Z}$ or $\mathbf{Q}$).

hecke_matrix(*n*)

Return the matrix of the n-th Hecke operator acting on this homology group.

EXAMPLES:

```
sage: t = J1(13).homology(GF(3)).hecke_matrix(3); t
[0 0 2 1]
[1 1 0 2]
[1 1 0 0]
[0 1 2 1]
sage: t.base_ring()
Finite Field of size 3
```

class **Homology_submodule**(*ambient, submodule*)

A submodule of the homology of a modular abelian variety.

ambient_hecke_module()
Return the ambient Hecke module that this homology is contained in.
EXAMPLES:

```
sage: H = J0(48).homology(); H
Integral Homology of Abelian variety J0(48) of dimension 3
sage: d = H.decomposition(); d
[
Submodule of rank 2 of Integral Homology of Abelian variety J0(48) of dimension 3,
Submodule of rank 4 of Integral Homology of Abelian variety J0(48) of dimension 3
]
sage: d[0].ambient_hecke_module()
Integral Homology of Abelian variety J0(48) of dimension 3
```

free_module()
Return the underlying free module of the homology group.
EXAMPLES:

```
sage: H = J0(48).homology()
sage: K = H.decomposition()[1]; K
Submodule of rank 4 of Integral Homology of Abelian variety J0(48) of dimension 3
sage: K.free_module()
Free module of degree 6 and rank 4 over Integer Ring
Echelon basis matrix:
[ 1  0  0  0  0  0]
[ 0  1  0  0  1 -1]
[ 0  0  1  0 -1  1]
[ 0  0  0  1  0 -1]
```

hecke_bound()
Return a bound on the number of Hecke operators needed to generate the Hecke algebra acting on this homology group.
EXAMPLES:

```
sage: d = J0(43).homology().decomposition(2); d
[
Submodule of rank 2 of Integral Homology of Abelian variety J0(43) of dimension 3,
Submodule of rank 4 of Integral Homology of Abelian variety J0(43) of dimension 3
]
```

Because the first factor has dimension 2 it corresponds to an elliptic curve, so we have a Hecke bound of 1.

```
sage: d[0].hecke_bound()
1
sage: d[1].hecke_bound()
8
```

hecke_matrix(*n*)
Return the matrix of the n-th Hecke operator acting on this homology group.
EXAMPLES:

```
sage: d = J0(125).homology(GF(17)).decomposition(2); d
[
Submodule of rank 4 of Homology with coefficients in Finite Field of size 17 of Abelian vari
Submodule of rank 4 of Homology with coefficients in Finite Field of size 17 of Abelian vari
Submodule of rank 8 of Homology with coefficients in Finite Field of size 17 of Abelian vari
]
sage: t = d[0].hecke_matrix(17); t
[16 15 15  0]
```

```
[ 0  5  0  2]
[ 2  0  5 15]
[ 0 15  0 16]
sage: t.base_ring()
Finite Field of size 17
sage: t.fcp()
(x^2 + 13*x + 16)^2
```

rank()

Return the rank of this homology group.

EXAMPLES:

```
sage: d = J0(43).homology().decomposition(2)
sage: [H.rank() for H in d]
[2, 4]
```

class IntegralHomology(*abvar*)

The integral homology $H_1(A, \mathbf{Z})$ of a modular abelian variety.

hecke_matrix(*n*)

Return the matrix of the n-th Hecke operator acting on this homology group.

EXAMPLES:

```
sage: J0(48).integral_homology().hecke_bound()
16
sage: t = J1(13).integral_homology().hecke_matrix(3); t
[ 0  0  2 -2]
[-2 -2  0  2]
[-2 -2  0  0]
[ 0 -2  2 -2]
sage: t.base_ring()
Integer Ring
```

hecke_polynomial(*n, var='x'*)

Return the n-th Hecke polynomial on this integral homology group.

EXAMPLES:

```
sage: f = J0(43).integral_homology().hecke_polynomial(2)
sage: f.base_ring()
Integer Ring
sage: factor(f)
(x + 2)^2 * (x^2 - 2)^2
```

class RationalHomology(*abvar*)

The rational homology $H_1(A, \mathbf{Q})$ of a modular abelian variety.

hecke_matrix(*n*)

Return the matrix of the n-th Hecke operator acting on this homology group.

EXAMPLES:

```
sage: t = J1(13).homology(QQ).hecke_matrix(3); t
[ 0  0  2 -2]
[-2 -2  0  2]
[-2 -2  0  0]
[ 0 -2  2 -2]
sage: t.base_ring()
Rational Field
sage: t = J1(13).homology(GF(3)).hecke_matrix(3); t
[0 0 2 1]
```

```
[1 1 0 2]
[1 1 0 0]
[0 1 2 1]
sage: t.base_ring()
Finite Field of size 3
```

hecke_polynomial(*n, var='x'*)

Return the n-th Hecke polynomial on this rational homology group.

EXAMPLES:

```
sage: f = J0(43).rational_homology().hecke_polynomial(2)
sage: f.base_ring()
Rational Field
sage: factor(f)
(x + 2) * (x^2 - 2)
```

46.8 Spaces of homomorphisms between modular abelian varieties.

EXAMPLES:

First, we consider J0(37). This Jacobian has two simple factors, corresponding to distinct newforms. These two intersect nontrivially in J0(37).

```
sage: J = J0(37)
sage: D = J.decomposition() ; D
[
Simple abelian subvariety 37a(1,37) of dimension 1 of J0(37),
Simple abelian subvariety 37b(1,37) of dimension 1 of J0(37)
]
sage: D[0].intersection(D[1])
(Finite subgroup with invariants [2, 2] over QQ of Simple abelian subvariety 37a(1,37) of dimension 1
 Simple abelian subvariety of dimension 0 of J0(37))
```

As an abstract product, since these newforms are distinct, the corresponding simple abelian varieties are not isogenous, and so there are no maps between them. The endomorphism ring of the corresponding product is thus isomorphic to the direct sum of the endomorphism rings for each factor. Since the factors correspond to abelian varieties of dimension 1, these endomorphism rings are each isomorphic to ZZ.

```
sage: Hom(D[0],D[1]).gens()
()
sage: A = D[0] * D[1] ; A
Abelian subvariety of dimension 2 of J0(37) x J0(37)
sage: A.endomorphism_ring().gens()
(Abelian variety endomorphism of Abelian subvariety of dimension 2 of J0(37) x J0(37),
 Abelian variety endomorphism of Abelian subvariety of dimension 2 of J0(37) x J0(37))
sage: [ x.matrix() for x in A.endomorphism_ring().gens() ]
[[1 0 0 0]
[0 1 0 0]
[0 0 0 0]
[0 0 0 0],
 [0 0 0 0]
[0 0 0 0]
[0 0 1 0]
[0 0 0 1]]
```

However, these two newforms have a congruence between them modulo 2, which gives rise to interesting endomorphisms of J0(37).

```
sage: E = J.endomorphism_ring()
sage: E.gens()
(Abelian variety endomorphism of Abelian variety J0(37) of dimension 2,
 Abelian variety endomorphism of Abelian variety J0(37) of dimension 2)
sage: [ x.matrix() for x in E.gens() ]
[[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1],
 [ 0  1  1 -1]
[ 1  0  1  0]
[ 0  0 -1  1]
[ 0  0  0  1]]
sage: (-1*E.gens()[0] + E.gens()[1]).matrix()
[-1  1  1 -1]
[ 1 -1  1  0]
[ 0  0 -2  1]
[ 0  0  0  0]
```

Of course, these endomorphisms will be reflected in the Hecke algebra, which is in fact the full endomorphism ring of J0(37) in this case:

```
sage: J.hecke_operator(2).matrix()
[-1  1  1 -1]
[ 1 -1  1  0]
[ 0  0 -2  1]
[ 0  0  0  0]
sage: T = E.image_of_hecke_algebra()
sage: T.gens()
(Abelian variety endomorphism of Abelian variety J0(37) of dimension 2,
 Abelian variety endomorphism of Abelian variety J0(37) of dimension 2)
sage: [ x.matrix() for x in T.gens() ]
[[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1],
 [ 0  1  1 -1]
[ 1  0  1  0]
[ 0  0 -1  1]
[ 0  0  0  1]]
sage: T.index_in(E)
1
```

Next, we consider J0(33). In this case, we have both oldforms and newforms. There are two copies of J0(11), one for each degeneracy map from J0(11) to J0(33). There is also one newform at level 33. The images of the two degeneracy maps are, of course, isogenous.

```
sage: J = J0(33)
sage: D = J.decomposition()
sage: D
[
Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33),
Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33),
Simple abelian subvariety 33a(1,33) of dimension 1 of J0(33)
```

```
]
sage: Hom(D[0],D[1]).gens()
(Abelian variety morphism:
  From: Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33)
  To:   Simple abelian subvariety 11a(3,33) of dimension 1 of J0(33),)
sage: Hom(D[0],D[1]).gens()[0].matrix()
[ 0  1]
[-1  0]
```

Then this gives that the component corresponding to the sum of the oldforms will have a rank 4 endomorphism ring. We also have a rank one endomorphism ring for the newform 33a (since it is again 1-dimensional), which gives a rank 5 endomorphism ring for J0(33).

```
sage: DD = J.decomposition(simple=False) ; DD
[
Abelian subvariety of dimension 2 of J0(33),
Abelian subvariety of dimension 1 of J0(33)
]
sage: A, B = DD
sage: A == D[0] + D[1]
True
sage: A.endomorphism_ring().gens()
(Abelian variety endomorphism of Abelian subvariety of dimension 2 of J0(33),
 Abelian variety endomorphism of Abelian subvariety of dimension 2 of J0(33),
 Abelian variety endomorphism of Abelian subvariety of dimension 2 of J0(33),
 Abelian variety endomorphism of Abelian subvariety of dimension 2 of J0(33))
sage: B.endomorphism_ring().gens()
(Abelian variety endomorphism of Abelian subvariety of dimension 1 of J0(33),)
sage: E = J.endomorphism_ring() ; E.gens()
(Abelian variety endomorphism of Abelian variety J0(33) of dimension 3,
 Abelian variety endomorphism of Abelian variety J0(33) of dimension 3,
 Abelian variety endomorphism of Abelian variety J0(33) of dimension 3,
 Abelian variety endomorphism of Abelian variety J0(33) of dimension 3,
 Abelian variety endomorphism of Abelian variety J0(33) of dimension 3)
```

In this case, the image of the Hecke algebra will only have rank 3, so that it is of infinite index in the full endomorphism ring. However, if we call this image T, we can still ask about the index of T in its saturation, which is 1 in this case.

```
sage: T = E.image_of_hecke_algebra()
sage: T.gens()
(Abelian variety endomorphism of Abelian variety J0(33) of dimension 3,
 Abelian variety endomorphism of Abelian variety J0(33) of dimension 3,
 Abelian variety endomorphism of Abelian variety J0(33) of dimension 3)
sage: T.index_in(E)
+Infinity
sage: T.index_in_saturation()
1
```

AUTHORS:

- William Stein (2007-03)
- Craig Citro, Robert Bradshaw (2008-03): Rewrote with modabvar overhaul

class `EndomorphismSubring`(*A, gens=None*)

abelian_variety()

Return the abelian variety that this endomorphism ring is attached to.

EXAMPLES:

```
sage: J0(11).endomorphism_ring().abelian_variety()
Abelian variety J0(11) of dimension 1
```

discriminant()

Return the discriminant of this ring, which is the discriminant of the trace pairing.

Note: One knows that for modular abelian varieties, the endomorphism ring should be isomorphic to an order in a number field. However, the discriminant returned by this function will be 2^n (n = self.dimension()) times the discriminant of that order, since the elements are represented as 2d x 2d matrices. Notice, for example, that the case of a one dimensional abelian variety, whose endomorphism ring must be ZZ, has discriminant 2, as in the example below.

EXAMPLES:

```
sage: J0(33).endomorphism_ring().discriminant()
-64800
sage: J0(46).endomorphism_ring().discriminant()
24200000000
sage: J0(11).endomorphism_ring().discriminant()
2
```

image_of_hecke_algebra(*check_every=1*)

Compute the image of the Hecke algebra inside this endomorphism subring.

We simply calculate Hecke operators up to the Sturm bound, and look at the submodule spanned by them. While computing, we can check to see if the submodule spanned so far is saturated and of maximal dimension, in which case we may be done. The optional argument check_every determines how many Hecke operators we add in before checking to see if this condition is met.

EXAMPLES:

```
sage: E = J0(33).endomorphism_ring()
sage: E.image_of_hecke_algebra()
Subring of endomorphism ring of Abelian variety J0(33) of dimension 3
sage: E.image_of_hecke_algebra().gens()
(Abelian variety endomorphism of Abelian variety J0(33) of dimension 3,
 Abelian variety endomorphism of Abelian variety J0(33) of dimension 3,
 Abelian variety endomorphism of Abelian variety J0(33) of dimension 3)
sage: [ x.matrix() for x in E.image_of_hecke_algebra().gens() ]
[[1 0 0 0 0 0]
[0 1 0 0 0 0]
[0 0 1 0 0 0]
[0 0 0 1 0 0]
[0 0 0 0 1 0]
[0 0 0 0 0 1],
 [ 0  2  0 -1  1 -1]
[-1 -2  2 -1  2 -1]
[ 0  0  1 -1  3 -1]
[-2  2  0  1  1 -1]
[-1  1  0  2  0 -3]
[-1  1 -1  1  1 -2],
 [ 0  0  1 -1  1 -1]
[ 0 -1  1  0  1 -1]
[ 0  0  1  0  2 -2]
[-2  0  1  1  1 -1]
[-1  0  1  1  0 -1]
[-1  0  0  1  0 -1]]
sage: J0(33).hecke_operator(2).matrix()
```

```
[-1  0  1 -1  1 -1]
[ 0 -2  1  0  1 -1]
[ 0  0  0  0  2 -2]
[-2  0  1  0  1 -1]
[-1  0  1  1 -1 -1]
[-1  0  0  1  0 -2]
```

index_in(*other, check=True*)

Return the index of self in other.

INPUT:

- `other` - another endomorphism subring of the same abelian variety
- `check` - bool (default: True); whether to do some type and other consistency checks

EXAMPLES:

```
sage: R = J0(33).endomorphism_ring()
sage: R.index_in(R)
1
sage: J = J0(37) ; E = J.endomorphism_ring() ; T = E.image_of_hecke_algebra()
sage: T.index_in(E)
1
sage: J = J0(22) ; E = J.endomorphism_ring() ; T = E.image_of_hecke_algebra()
sage: T.index_in(E)
+Infinity
```

index_in_saturation()

Given a Hecke algebra T, compute its index in its saturation.

EXAMPLES:

```
sage: End(J0(23)).image_of_hecke_algebra().index_in_saturation()
1
sage: End(J0(44)).image_of_hecke_algebra().index_in_saturation()
2
```

class Homspace(*domain, codomain, cat*)

A space of homomorphisms between two modular abelian varieties.

calculate_generators()

If generators haven't already been computed, calculate generators for this homspace. If they have been computed, do nothing.

EXAMPLES:

```
sage: E = End(J0(11))
sage: E.calculate_generators()
```

free_module()

Return this endomorphism ring as a free submodule of a big $\mathbf{Z}^{4nm}$, where n is the dimension of the domain abelian variety and m the dimension of the codomain.

OUTPUT: free module

EXAMPLES:

```
sage: E = Hom(J0(11), J0(22))
sage: E.free_module()
Free module of degree 8 and rank 2 over Integer Ring
Echelon basis matrix:
[ 1  0 -3  1  1  1 -1 -1]
[ 0  1 -3  1  1  1 -1  0]
```

gen(*i=0*)

Return i-th generator of self.

INPUT:

- `i` - an integer

OUTPUT: a morphism

EXAMPLES:

```
sage: E = End(J0(22))
sage: E.gen(0).matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

gens()

Return tuple of generators for this endomorphism ring.

EXAMPLES:

```
sage: E = End(J0(22))
sage: E.gens()
(Abelian variety endomorphism of Abelian variety J0(22) of dimension 2,
 Abelian variety endomorphism of Abelian variety J0(22) of dimension 2,
 Abelian variety endomorphism of Abelian variety J0(22) of dimension 2,
 Abelian variety endomorphism of Abelian variety J0(22) of dimension 2)
```

matrix_space()

Return the underlying matrix space that we view this endomorphism ring as being embedded into.

EXAMPLES:

```
sage: E = End(J0(22))
sage: E.matrix_space()
Full MatrixSpace of 4 by 4 dense matrices over Integer Ring
```

ngens()

Return number of generators of self.

OUTPUT: integer

EXAMPLES:

```
sage: E = End(J0(22))
sage: E.ngens()
4
```

46.9 Morphisms between modular abelian varieties, including Hecke operators acting on modular abelian varieties.

Sage can compute with Hecke operators on modular abelian varieties. A Hecke operator is defined by given a modular abelian variety and an index. Given a Hecke operator, Sage can compute the characteristic polynomial, and the action of the Hecke operator on various homology groups.

AUTHORS:

- William Stein (2007-03)
- Craig Citro (2008-03)

EXAMPLES:

```
sage: A = J0(54)
sage: t5 = A.hecke_operator(5); t5
Hecke operator T_5 on Abelian variety J0(54) of dimension 4
sage: t5.charpoly().factor()
(x - 3) * (x + 3) * x^2
sage: B = A.new_subvariety(); B
Abelian subvariety of dimension 2 of J0(54)
sage: t5 = B.hecke_operator(5); t5
Hecke operator T_5 on Abelian subvariety of dimension 2 of J0(54)
sage: t5.charpoly().factor()
(x - 3) * (x + 3)
sage: t5.action_on_homology().matrix()
[ 0  3  3 -3]
[-3  3  3  0]
[ 3  3  0 -3]
[-3  6  3 -3]
```

class DegeneracyMap (*parent, A, t*)

t()

Return the list of indices defining self.

EXAMPLES:

```
sage: J0(22).degeneracy_map(44).t()
[1]
sage: J = J0(22) * J0(11)
sage: J.degeneracy_map([44,44], [2,1])
Degeneracy map from Abelian variety J0(22) x J0(11) of dimension 3 to Abelian variety J0(44)
sage: J.degeneracy_map([44,44], [2,1]).t()
[2, 1]
```

class HeckeOperator (*abvar, n*)

A Hecke operator acting on a modular abelian variety.

action_on_homology (*R=Integer Ring*)

Return the action of this Hecke operator on the homology $H_1(A; R)$ of this abelian variety with coefficients in R.

EXAMPLES:

```
sage: A = J0(43)
sage: t2 = A.hecke_operator(2); t2
Hecke operator T_2 on Abelian variety J0(43) of dimension 3
sage: h2 = t2.action_on_homology(); h2
Hecke operator T_2 on Integral Homology of Abelian variety J0(43) of dimension 3
sage: h2.matrix()
[-2  1  0  0  0  0]
[-1  1  1  0 -1  0]
[-1  0 -1  2 -1  1]
[-1  0  1  1 -1  1]
[ 0 -2  0  2 -2  1]
[ 0 -1  0  1  0 -1]
sage: h2 = t2.action_on_homology(GF(2)); h2
Hecke operator T_2 on Homology with coefficients in Finite Field of size 2 of Abelian variet
sage: h2.matrix()
[0 1 0 0 0 0]
[1 1 1 0 1 0]
```

```
[1 0 1 0 1 1]
[1 0 1 1 1 1]
[0 0 0 0 0 1]
[0 1 0 1 0 1]
```

characteristic_polynomial(*var='x'*)

Return the characteristic polynomial of this Hecke operator in the given variable.

INPUT:

- `var` - a string (default: 'x')

OUTPUT: a polynomial in var over the rational numbers.

EXAMPLES:

```
sage: A = J0(43)[1]; A
Simple abelian subvariety 43b(1,43) of dimension 2 of J0(43)
sage: t2 = A.hecke_operator(2); t2
Hecke operator T_2 on Simple abelian subvariety 43b(1,43) of dimension 2 of J0(43)
sage: f = t2.characteristic_polynomial(); f
x^2 - 2
sage: f.parent()
Univariate Polynomial Ring in x over Integer Ring
sage: f.factor()
x^2 - 2
sage: t2.characteristic_polynomial('y')
y^2 - 2
```

charpoly(*var='x'*)

Synonym for `self.characteristic_polynomial(var)`.

INPUT:

- `var` - string (default: 'x')

EXAMPLES:

```
sage: A = J1(13)
sage: t2 = A.hecke_operator(2); t2
Hecke operator T_2 on Abelian variety J1(13) of dimension 2
sage: f = t2.charpoly(); f
x^2 + 3*x + 3
sage: f.factor()
x^2 + 3*x + 3
sage: t2.charpoly('y')
y^2 + 3*y + 3
```

index()

Return the index of this Hecke operator. (For example, if this is the operator T_n, then the index is the integer n.)

OUTPUT:

- `n` - a (Sage) Integer

EXAMPLES:

```
sage: J = J0(15)
sage: t = J.hecke_operator(53)
sage: t
Hecke operator T_53 on Abelian variety J0(15) of dimension 1
sage: t.index()
53
sage: t = J.hecke_operator(54)
sage: t
```

```
Hecke operator T_54 on Abelian variety J0(15) of dimension 1
sage: t.index()
54

sage: J = J1(12345)
sage: t = J.hecke_operator(997) ; t
Hecke operator T_997 on Abelian variety J1(12345) of dimension 5405473
sage: t.index()
997
sage: type(t.index())
<type 'sage.rings.integer.Integer'>
```

matrix()

Return the matrix of self acting on the homology $H_1(A, ZZ)$ of this abelian variety with coefficients in **Z**.

EXAMPLES:

```
sage: J0(47).hecke_operator(3).matrix()
[ 0  0  1 -2  1  0 -1  0]
[ 0  0  1  0 -1  0  0  0]
[-1  2  0  0  2 -2  1 -1]
[-2  1  1 -1  3 -1 -1  0]
[-1 -1  1  0  1  0 -1  1]
[-1  0  0 -1  2  0 -1  0]
[-1 -1  2 -2  2  0 -1  0]
[ 0 -1  0  0  1  0 -1  1]

sage: J0(11).hecke_operator(7).matrix()
[-2  0]
[ 0 -2]
sage: (J0(11) * J0(33)).hecke_operator(7).matrix()
[-2  0  0  0  0  0  0  0]
[ 0 -2  0  0  0  0  0  0]
[ 0  0  0  0  2 -2  2 -2]
[ 0  0  0 -2  2  0  2 -2]
[ 0  0  0  0  2  0  4 -4]
[ 0  0 -4  0  2  2  2 -2]
[ 0  0 -2  0  2  2  0 -2]
[ 0  0 -2  0  0  2  0 -2]

sage: J0(23).hecke_operator(2).matrix()
[ 0  1 -1  0]
[ 0  1 -1  1]
[-1  2 -2  1]
[-1  1  0 -1]
```

n()

Alias for `self.index()`.

EXAMPLES:

```
sage: J = J0(17)
sage: J.hecke_operator(5).n()
5
```

class Morphism(*parent, A*)

restrict_domain(*sub*)

Restrict self to the subvariety sub of self.domain().

EXAMPLES:

```
sage: J = J0(37) ; A, B = J.decomposition()
sage: A.lattice().matrix()
[ 1 -1  1  0]
[ 0  0  2 -1]
sage: B.lattice().matrix()
[1 1 1 0]
[0 0 0 1]
sage: T = J.hecke_operator(2) ; T.matrix()
[-1  1  1 -1]
[ 1 -1  1  0]
[ 0  0 -2  1]
[ 0  0  0  0]
sage: T.restrict_domain(A)
Abelian variety morphism:
  From: Simple abelian subvariety 37a(1,37) of dimension 1 of J0(37)
  To:   Abelian variety J0(37) of dimension 2
sage: T.restrict_domain(A).matrix()
[-2  2 -2  0]
[ 0  0 -4  2]
sage: T.restrict_domain(B)
Abelian variety morphism:
  From: Simple abelian subvariety 37b(1,37) of dimension 1 of J0(37)
  To:   Abelian variety J0(37) of dimension 2
sage: T.restrict_domain(B).matrix()
[0 0 0 0]
[0 0 0 0]
```

class Morphism_abstract (*parent*)

A morphism between modular abelian varieties. EXAMPLES:

```
sage: t = J0(11).hecke_operator(2)
sage: from sage.modular.abvar.morphism import Morphism
sage: isinstance(t, Morphism)
True
```

cokernel()

Return the cokernel of self.

OUTPUT:

- A - an abelian variety (the cokernel)
- phi - a quotient map from self.codomain() to the cokernel of self

EXAMPLES:

```
sage: t = J0(33).hecke_operator(2)
sage: (t-1).cokernel()
(Abelian subvariety of dimension 1 of J0(33),
 Abelian variety morphism:
  From: Abelian variety J0(33) of dimension 3
  To:   Abelian subvariety of dimension 1 of J0(33))
```

Projection will always have cokernel zero.

```
sage: J0(37).projection(J0(37)[0]).cokernel()
(Simple abelian subvariety of dimension 0 of J0(37),
 Abelian variety morphism:
  From: Simple abelian subvariety 37a(1,37) of dimension 1 of J0(37)
  To:   Simple abelian subvariety of dimension 0 of J0(37))
```

Here we have a nontrivial cokernel of a Hecke operator, as the T_2-eigenvalue for the newform 37b is 0.

```
sage: J0(37).hecke_operator(2).cokernel()
(Abelian subvariety of dimension 1 of J0(37),
 Abelian variety morphism:
  From: Abelian variety J0(37) of dimension 2
  To:   Abelian subvariety of dimension 1 of J0(37))
sage: AbelianVariety('37b').newform().q_expansion(5)
q + q^3 - 2*q^4 + O(q^5)
```

complementary_isogeny()

Returns the complementary isogeny of self.

EXAMPLES:

```
sage: J = J0(43)
sage: A = J[1]
sage: T5 = A.hecke_operator(5)
sage: T5.is_isogeny()
True
sage: T5.complementary_isogeny()
Abelian variety endomorphism of Simple abelian subvariety 43b(1,43) of dimension 2 of J0(43)
sage: (T5.complementary_isogeny() * T5).matrix()
[2 0 0 0]
[0 2 0 0]
[0 0 2 0]
[0 0 0 2]
```

factor_out_component_group()

View self as a morphism $f : A \to B$. Then $\ker(f)$ is an extension of an abelian variety C by a finite component group G. This function constructs a morphism g with domain A and codomain Q isogenous to C such that $\ker(g)$ is equal to C.

OUTPUT: a morphism

EXAMPLES:

```
sage: A,B,C = J0(33)
sage: pi = J0(33).projection(A)
sage: pi.kernel()
(Finite subgroup with invariants [5] over QQbar of Abelian variety J0(33) of dimension 3,
 Abelian subvariety of dimension 2 of J0(33))
sage: psi = pi.factor_out_component_group()
sage: psi.kernel()
(Finite subgroup with invariants [] over QQbar of Abelian variety J0(33) of dimension 3,
 Abelian subvariety of dimension 2 of J0(33))
```

ALGORITHM: We compute a subgroup G of B so that the composition $h : A \to B \to B/G$ has kernel that contains $A[n]$ and component group isomorphic to $(\mathbf{Z}/n\mathbf{Z})^{2d}$, where d is the dimension of A. Then h factors through multiplication by n, so there is a morphism $g : A \to B/G$ such that $g \circ [n] = h$. Then g is the desired morphism. We give more details below about how to transform this into linear algebra.

image()

Return the image of this morphism.

OUTPUT: an abelian variety

EXAMPLES: We compute the image of projection onto a factor of $J_0(33)$:

```
sage: A,B,C = J0(33)
sage: A
Simple abelian subvariety 11a(1,33) of dimension 1 of J0(33)
sage: f = J0(33).projection(A)
sage: f.image()
Abelian subvariety of dimension 1 of J0(33)
```

```
sage: f.image() == A
True
```

We compute the image of a Hecke operator:

```
sage: t2 = J0(33).hecke_operator(2); t2.fcp()
(x - 1) * (x + 2)^2
sage: phi = t2 + 2
sage: phi.image()
Abelian subvariety of dimension 1 of J0(33)
```

The sum of the image and the kernel is the whole space:

```
sage: phi.kernel()[1] + phi.image() == J0(33)
True
```

is_isogeny()

Return True if this morphism is an isogeny of abelian varieties.

EXAMPLES:

```
sage: J = J0(39)
sage: Id = J.hecke_operator(1)
sage: Id.is_isogeny()
True
sage: J.hecke_operator(19).is_isogeny()
False
```

kernel()

Return the kernel of this morphism.

OUTPUT:

- G - a finite group
- A - an abelian variety (identity component of the kernel)

EXAMPLES: We compute the kernel of a projection map. Notice that the kernel has a nontrivial abelian variety part.

```
sage: A, B, C = J0(33)
sage: pi = J0(33).projection(B)
sage: pi.kernel()
(Finite subgroup with invariants [20] over QQbar of Abelian variety J0(33) of dimension 3,
 Abelian subvariety of dimension 2 of J0(33))
```

We compute the kernels of some Hecke operators:

```
sage: t2 = J0(33).hecke_operator(2)
sage: t2
Hecke operator T_2 on Abelian variety J0(33) of dimension 3
sage: t2.kernel()
(Finite subgroup with invariants [2, 2, 2, 2] over QQ of Abelian variety J0(33) of dimensior
 Abelian subvariety of dimension 0 of J0(33))
sage: t3 = J0(33).hecke_operator(3)
sage: t3.kernel()
(Finite subgroup with invariants [3, 3] over QQ of Abelian variety J0(33) of dimension 3,
 Abelian subvariety of dimension 0 of J0(33))
```

46.10 Abelian varieties attached to newforms

TESTS:

```
sage: A = AbelianVariety('23a')
sage: loads(dumps(A)) == A
True
```

class ModularAbelianVariety_newform(*f, internal_name=False*)

A modular abelian variety attached to a specific newform.

endomorphism_ring()

Return the endomorphism ring of this newform abelian variety.

EXAMPLES:

```
sage: A = AbelianVariety('23a')
sage: E = A.endomorphism_ring(); E
Endomorphism ring of Newform abelian subvariety 23a of dimension 2 of J0(23)
```

We display the matrices of these two basis matrices:

```
sage: E.0.matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
sage: E.1.matrix()
[ 0  1 -1  0]
[ 0  1 -1  1]
[-1  2 -2  1]
[-1  1  0 -1]
```

The result is cached:

```
sage: E is A.endomorphism_ring()
True
```

factor_number()

Return factor number.

OUTPUT: int

EXAMPLES:

```
sage: A = AbelianVariety('43b')
sage: A.factor_number()
1
```

label()

Return canonical label that defines this newform modular abelian variety.

OUTPUT: string

EXAMPLES:

```
sage: A = AbelianVariety('43b')
sage: A.label()
'43b'
```

newform(*names=None*)

Return the newform that this modular abelian variety is attached to.

EXAMPLES:

```
sage: f = Newform('37a')
sage: A = f.abelian_variety()
sage: A.newform()
q - 2*q^2 - 3*q^3 + 2*q^4 - 2*q^5 + O(q^6)
```

```
sage: A.newform() is f
True
```

If the a variable name has not been specified, we must specify one:

```
sage: A = AbelianVariety('67b')
sage: A.newform()
...
TypeError: You must specify the name of the generator.
sage: A.newform('alpha')
q + alpha*q^2 + (-alpha - 3)*q^3 + (-3*alpha - 3)*q^4 - 3*q^5 + O(q^6)
```

If the eigenform is actually over $\mathbf{Q}$ then we don't have to specify the name:

```
sage: A = AbelianVariety('67a')
sage: A.newform()
q + 2*q^2 - 2*q^3 + 2*q^4 + 2*q^5 + O(q^6)
```

46.11 L-series of modular abelian varieties

At the moment very little functionality is implemented – this is mostly a placeholder for future planned work.

AUTHOR:

- William Stein (2007-03)

TESTS:

```
sage: L = J0(37)[0].padic_lseries(5)
sage: loads(dumps(L)) == L
True
sage: L = J0(37)[0].lseries()
sage: loads(dumps(L)) == L
True
```

class **Lseries**(*abvar*)

Base class for L-series attached to modular abelian varieties.

abelian_variety()

Return the abelian variety that this L-series is attached to.

OUTPUT: a modular abelian variety

EXAMPLES:

```
sage: J0(11).padic_lseries(7).abelian_variety()
Abelian variety J0(11) of dimension 1
```

class **Lseries_complex**(*abvar*)

A complex L-series attached to a modular abelian variety.

EXAMPLES:

```
sage: A = J0(37)
sage: A.lseries()
Complex L-series attached to Abelian variety J0(37) of dimension 2
```

rational_part()

Return the rational part of this L-function at the central critical value 1.

NOTE: This is not yet implemented.

EXAMPLES:

```
sage: J0(37).lseries().rational_part()
...
NotImplementedError
```

class **Lseries_padic**(*abvar, p*)

A p-adic L-series attached to a modular abelian variety.

power_series(*n=2, prec=5*)

Return the n-th approximation to this p-adic L-series as a power series in T. Each coefficient is a p-adic number whose precision is provably correct.

NOTE: This is not yet implemented.

EXAMPLES:

```
sage: L = J0(37)[0].padic_lseries(5)
sage: L.power_series()
...
NotImplementedError
sage: L.power_series(3,7)
...
NotImplementedError
```

prime()

Return the prime p of this p-adic L-series.

EXAMPLES:

```
sage: J0(11).padic_lseries(7).prime()
7
```

CHAPTER

FORTYSEVEN

MISCELLANEOUS MODULAR-FORM-RELATED MODULES

47.1 Dirichlet characters

A `DirichletCharacter` is the extension of a homomorphism

$$(\mathbf{Z}/N\mathbf{Z})^* \to R^*,$$

for some ring R, to the map $\mathbf{Z}/N\mathbf{Z} \to R$ obtained by sending those $x \in \mathbf{Z}/N\mathbf{Z}$ with $\gcd(N, x) > 1$ to 0.

EXAMPLES:

```
sage: G = DirichletGroup(35)
sage: x = G.gens()
sage: e = x[0]*x[1]^2; e
[zeta12^3, zeta12^2 - 1]
sage: e.order()
12
```

This illustrates a canonical coercion.

```
sage: e = DirichletGroup(5, QQ).0
sage: f = DirichletGroup(5,CyclotomicField(4)).0
sage: e*f
[-zeta4]
```

AUTHORS:

- William Stein (2005-09-02): Fixed bug in comparison of Dirichlet characters. It was checking that their values were the same, but not checking that they had the same level!
- William Stein (2006-01-07): added more examples
- William Stein (2006-05-21): added examples of everything; fix a *lot* of tiny bugs and design problem that became clear when creating examples.
- Craig Citro (2008-02-16): speed up __call__ method for Dirichlet characters, miscellaneous fixes

class `DirichletCharacter` (*parent, x, check=True*)
A Dirichlet character

bar()
Return the complex conjugate of this Dirichlet character.
EXAMPLES:

```
sage: e = DirichletGroup(5).0
sage: e
[zeta4]
sage: e.bar()
[-zeta4]
```

base_ring()
Returns the base ring of this Dirichlet character.
EXAMPLES:

```
sage: G = DirichletGroup(11)
sage: G.gen(0).base_ring()
Cyclotomic Field of order 10 and degree 4
sage: G = DirichletGroup(11, RationalField())
sage: G.gen(0).base_ring()
Rational Field
```

bernoulli(*k, algorithm='recurrence', cache=True, **opts*)
Returns the generalized Bernoulli number $B_{k,eps}$.
INPUT:

- `k` - an integer
- `algorithm` - string (default: 'recurrence'); either 'recurrence' or 'definition'. The 'recurrence' algorithm expresses generalized Bernoulli numbers in terms of classical Bernoulli numbers using a recurrence formula and is usually optimal. In this case `**opts` is passed onto the bernoulli function.
- `cache` - if True, cache answers

Let eps be this character (not necessarily primitive), and let $k \geq 0$ be an integer weight. This function computes the (generalized) Bernoulli number $B_{k,eps}$, e.g., as defined on page 44 of Diamond-Im:

$$\sum_{a=1}^{N} \varepsilon(a) t * e^{at}/(e^{Nt} - 1) = sum_{k=0}^{\infty} B_{k,eps}/k! t^k.$$

where N is the modulus of ε.
The default algorithm is the recurrence on page 656 of Cohen's GTM 'Number Theory and Diophantine Equations', section 9.
EXAMPLES:

```
sage: G = DirichletGroup(13)
sage: e = G.0
sage: e.bernoulli(5)
7430/13*zeta12^3 - 34750/13*zeta12^2 - 11380/13*zeta12 + 9110/13
sage: eps = DirichletGroup(9).0
sage: eps.bernoulli(3)
10*zeta6 + 4
sage: eps.bernoulli(3, algorithm="definition")
10*zeta6 + 4
```

change_ring(*R*)
Returns the base extension of self to the ring R.
EXAMPLE:

```
sage: e = DirichletGroup(7, QQ).0
sage: f = e.change_ring(QuadraticField(3, 'a'))
sage: f.parent()
Group of Dirichlet characters of modulus 7 over Number Field in a with defining polynomial x
```

```
sage: e = DirichletGroup(13).0
sage: e.change_ring(QQ)
...
ValueError: cannot coerce element of order 12 into self
```

conductor()

Computes and returns the conductor of this character.

EXAMPLES:

```
sage: G.<a,b> = DirichletGroup(20)
sage: a.conductor()
4
sage: b.conductor()
5
sage: (a*b).conductor()
20
```

decomposition()

Return the decomposition of self as a product of Dirichlet characters of prime power modulus, where the prime powers exactly divide the modulus of this character.

EXAMPLES:

```
sage: G.<a,b> = DirichletGroup(20)
sage: c = a*b
sage: d = c.decomposition(); d
[[-1], [zeta4]]
sage: d[0].parent()
Group of Dirichlet characters of modulus 4 over Cyclotomic Field of order 4 and degree 2
sage: d[1].parent()
Group of Dirichlet characters of modulus 5 over Cyclotomic Field of order 4 and degree 2
```

We can't multiply directly, since coercion of one element into the other parent fails in both cases:

```
sage: d[0]*d[1] == c
...
TypeError: unsupported operand parent(s) for '*': 'Group of Dirichlet characters of modulus
```

We can multiply if we're explicit about where we want the multiplication to take place.

```
sage: G(d[0])*G(d[1]) == c
True
```

Conductors that are divisible by various powers of 2 present some problems as the multiplicative group modulo 2^k is trivial for $k = 1$ and non-cyclic for $k \geq 3$:

```
sage: (DirichletGroup(18).0).decomposition()
[[], [zeta6]]
sage: (DirichletGroup(36).0).decomposition()
[[-1], [1]]
sage: (DirichletGroup(72).0).decomposition()
[[-1, 1], [1]]
```

element()

Return the underlying $\mathbf{Z}/n\mathbf{Z}$-module vector of exponents.

Warning: Please do not change the entries of the returned vector; this vector is mutable *only* because immutable vectors are implemented yet.

EXAMPLE:

```
sage: G.<a,b> = DirichletGroup(20)
sage: a.element()
(2, 0)
sage: b.element()
(0, 1)
```

extend(*M*)

Returns the extension of this character to a Dirichlet character modulo the multiple M of the modulus.

EXAMPLES:

```
sage: G.<a,b> = DirichletGroup(20)
sage: H.<c> = DirichletGroup(4)
sage: c.extend(20)
[-1, 1]
sage: a
[-1, 1]
sage: c.extend(20) == a
True
```

galois_orbit(*sort=True*)

Return the orbit of this character under the action of the absolute Galois group of the prime subfield of the base ring.

EXAMPLES:

```
sage: G = DirichletGroup(30); e = G.1
sage: e.galois_orbit()
[[1, zeta4], [1, -zeta4]]
```

Another example:

```
sage: G = DirichletGroup(13)
sage: G.galois_orbits()
[
[[1]],
[[zeta12], [zeta12^3 - zeta12], [-zeta12], [-zeta12^3 + zeta12]],
[[zeta12^2], [-zeta12^2 + 1]],
[[zeta12^3], [-zeta12^3]],
[[zeta12^2 - 1], [-zeta12^2]],
[[-1]]
]
sage: e = G.0
sage: e
[zeta12]
sage: e.galois_orbit()
[[zeta12], [zeta12^3 - zeta12], [-zeta12], [-zeta12^3 + zeta12]]
sage: e = G.0^2; e
[zeta12^2]
sage: e.galois_orbit()
[[zeta12^2], [-zeta12^2 + 1]]
```

A non-example:

```
sage: chi = DirichletGroup(7, Integers(9), zeta = Integers(9)(2)).0
sage: chi.galois_orbit()
...
TypeError: Galois orbits only defined if base ring is an integral domain
```

gauss_sum(*a=1*)

Return a Gauss sum associated to this Dirichlet character.

The Gauss sum associated to χ is

$$g_a(\chi) = \sum_{r \in \mathbf{Z}/m\mathbf{Z}} \chi(r)\,\zeta^{ar},$$

where m is the modulus of χ and ζ is a primitive m^{th} root of unity, i.e., ζ is `self.parent().zeta()`.
FACTS: If the modulus is a prime p and the character is nontrivial, then the Gauss sum has absolute value $\sqrt{p}$.
CACHING: Computed Gauss sums are *not* cached with this character.
EXAMPLES:

```
sage: G = DirichletGroup(3)
sage: e = G([-1])
sage: e.gauss_sum(1)
2*zeta6 - 1
sage: e.gauss_sum(2)
-2*zeta6 + 1
sage: norm(e.gauss_sum())
3

sage: G = DirichletGroup(13)
sage: e = G.0
sage: e.gauss_sum()
-zeta156^46 + zeta156^45 + zeta156^42 + zeta156^41 + 2*zeta156^40 + zeta156^37 - zeta156^36
sage: factor(norm(e.gauss_sum()))
13^24
```

gauss_sum_numerical(*prec=53, a=1*)

Return a Gauss sum associated to this Dirichlet character as an approximate complex number with prec bits of precision.
INPUT:

- `prec` - integer (default: 53), *bits* of precision
- `a` - integer, as for gauss_sum.

The Gauss sum associated to χ is

$$g_a(\chi) = \sum_{r \in \mathbf{Z}/m\mathbf{Z}} \chi(r)\,\zeta^{ar},$$

where m is the modulus of χ and ζ is a primitive m^{th} root of unity, i.e., ζ is `self.parent().zeta()`.
EXAMPLES:

```
sage: G = DirichletGroup(3)
sage: e = G.0
sage: abs(e.gauss_sum_numerical())
1.7320508075...
sage: sqrt(3.0)
1.73205080756888
sage: e.gauss_sum_numerical(a=2)
-...e-15 - 1.7320508075...*I
sage: e.gauss_sum_numerical(a=2, prec=100)
4.7331654313260708324703713917e-30 - 1.7320508075688772935274463415*I
sage: G = DirichletGroup(13)
sage: e = G.0
sage: e.gauss_sum_numerical()
-3.07497205... + 1.8826966926...*I
sage: abs(e.gauss_sum_numerical())
3.60555127546...
```

```
sage: sqrt(13.0)
3.60555127546399
```

is_even()

Return `True` if and only if $\varepsilon(-1) = 1$.

EXAMPLES:

```
sage: G = DirichletGroup(13)
sage: e = G.0
sage: e.is_even()
False
sage: e(-1)
-1
sage: [e.is_even() for e in G]
[True, False, True, False, True, False, True, False, True, False, True, False]
```

Note that `is_even` need not be the negation of is_odd, e.g., in characteristic 2:

```
sage: G.<e> = DirichletGroup(13, GF(4,'a'))
sage: e.is_even()
True
sage: e.is_odd()
True
```

is_odd()

Return `True` if and only if $\varepsilon(-1) = -1$.

EXAMPLES:

```
sage: G = DirichletGroup(13)
sage: e = G.0
sage: e.is_odd()
True
sage: [e.is_odd() for e in G]
[False, True, False, True, False, True, False, True, False, True, False, True]
```

Note that `is_even` need not be the negation of is_odd, e.g., in characteristic 2:

```
sage: G.<e> = DirichletGroup(13, GF(4,'a'))
sage: e.is_even()
True
sage: e.is_odd()
True
```

is_primitive()

Return `True` if and only if this character is primitive, i.e., its conductor equals its modulus.

EXAMPLES:

```
sage: G.<a,b> = DirichletGroup(20)
sage: a.is_primitive()
False
sage: b.is_primitive()
False
sage: (a*b).is_primitive()
True
```

is_trivial()

Returns `True` if this is the trivial character, i.e., has order 1.

EXAMPLES:

```
sage: G.<a,b> = DirichletGroup(20)
sage: a.is_trivial()
False
sage: (a^2).is_trivial()
True
```

jacobi_sum(*char, check=True*)

Return the Jacobi sum associated to these Dirichlet characters (i.e., J(self,char)). This is defined as

$$J(\chi,\psi) = \sum_{a \in \mathbf{Z}/N\mathbf{Z}} \chi(a)\psi(1-a)$$

where χ and ψ are both characters modulo N.

EXAMPLES:

```
sage: D = DirichletGroup(13)
sage: e = D.0
sage: f = D[-2]
sage: e.jacobi_sum(f)
3*zeta12^2 + 2*zeta12 - 3
sage: f.jacobi_sum(e)
3*zeta12^2 + 2*zeta12 - 3
sage: p = 7
sage: DP = DirichletGroup(p)
sage: f = DP.0
sage: e.jacobi_sum(f)
...
NotImplementedError: Characters must be from the same Dirichlet Group.
sage: all_jacobi_sums = [(DP[i],DP[j],DP[i].jacobi_sum(DP[j])) ...
...
sage: for s in all_jacobi_sums:
...       print s
([1], [1], 5)
([1], [zeta6], -1)
([1], [zeta6 - 1], -1)
([1], [-1], -1)
([1], [-zeta6], -1)
([1], [-zeta6 + 1], -1)
([zeta6], [zeta6], -zeta6 + 3)
([zeta6], [zeta6 - 1], 2*zeta6 + 1)
([zeta6], [-1], -2*zeta6 - 1)
([zeta6], [-zeta6], zeta6 - 3)
([zeta6], [-zeta6 + 1], 1)
([zeta6 - 1], [zeta6 - 1], -3*zeta6 + 2)
([zeta6 - 1], [-1], 2*zeta6 + 1)
([zeta6 - 1], [-zeta6], -1)
([zeta6 - 1], [-zeta6 + 1], -zeta6 - 2)
([-1], [-1], 1)
([-1], [-zeta6], -2*zeta6 + 3)
([-1], [-zeta6 + 1], 2*zeta6 - 3)
([-zeta6], [-zeta6], 3*zeta6 - 1)
([-zeta6], [-zeta6 + 1], -2*zeta6 + 3)
([-zeta6 + 1], [-zeta6 + 1], zeta6 + 2)
```

Let's check that trivial sums are being calculated correctly:

```
sage: N = 13
sage: D = DirichletGroup(N)
sage: g = D(1)
```

```
sage: g.jacobi_sum(g)
11
sage: sum([g(x)*g(1-x) for x in IntegerModRing(N)])
11
```

And sums where exactly one character is nontrivial (see trac #6393):

```
sage: G=DirichletGroup(5); X=G.list(); Y=X[0]; Z=X[1]
sage: Y.jacobi_sum(Z)
-1
sage: Z.jacobi_sum(Y)
-1
```

Now let's take a look at a non-prime modulus:

```
sage: N = 9
sage: D = DirichletGroup(N)
sage: g = D(1)
sage: g.jacobi_sum(g)
3
```

We consider a sum with values in a finite field:

```
sage: g = DirichletGroup(17, GF(9,'a')).0
sage: g.jacobi_sum(g**2)
2*a
```

TESTS:

This shows that ticket #6393 has been fixed:

```
sage: G = DirichletGroup(5); X = G.list(); Y = X[0]; Z = X[1]
sage: # Y is trivial and Z is quartic
sage: sum([Y(x)*Z(1-x) for x in IntegerModRing(5)])
-1
sage: # The value -1 above is the correct value of the Jacobi sum J(Y, Z).
sage: Y.jacobi_sum(Z); Z.jacobi_sum(Y)
-1
-1
```

kernel()

Return the kernel of this character.

OUTPUT: Currently the kernel is returned as a list. This may change.

EXAMPLES:

```
sage: G.<a,b> = DirichletGroup(20)
sage: a.kernel()
[1, 9, 13, 17]
sage: b.kernel()
[1, 11]
```

kloosterman_sum(*a=1, b=0*)

Return the "twisted" Kloosterman sum associated to this Dirichlet character. This includes Gauss sums, classical Kloosterman sums, Salie sums, etc.

The Kloosterman sum associated to χ and the integers a,b is

$$K(a,b,\chi) = \sum_{r \in (\mathbf{Z}/m\mathbf{Z})^\times} \chi(r)\, \zeta^{ar+br^{-1}},$$

where m is the modulus of χ and ζ is a primitive m th root of unity. This reduces to to the Gauss sum if $b = 0$.

This method performs an exact calculation and returns an element of a suitable cyclotomic field; see also `kloosterman_sum_numerical()`, which gives an inexact answer (but is generally much quicker).

CACHING: Computed Kloosterman sums are *not* cached with this character.

EXAMPLES:

```
sage: G = DirichletGroup(3)
sage: e = G([-1])
sage: e.kloosterman_sum(3,5)
-2*zeta6 + 1
sage: G = DirichletGroup(20)
sage: e = G([1 for  u in G.unit_gens()])
sage: e.kloosterman_sum(7,17)
-2*zeta20^6 + 2*zeta20^4 + 4
```

kloosterman_sum_numerical (*prec=53, a=1, b=0*)

Return the Kloosterman sum associated to this Dirichlet character as an approximate complex number with prec bits of precision. See also `kloosterman_sum()`, which calculates the sum exactly (which is generally slower).

INPUT:

- `prec` – integer (default: 53), *bits* of precision
- `a` – integer, as for `kloosterman_sum()`
- `b` – integer, as for `kloosterman_sum()`.

EXAMPLES:

```
sage: G = DirichletGroup(3)
sage: e = G.0
```

The real component of the numerical value of e is near zero:

```
sage: v=e.kloosterman_sum_numerical()
sage: v.real() < 1.0e15
True
sage: v.imag()
1.73205080757
sage: G = DirichletGroup(20)
sage: e = G.1
sage: e.kloosterman_sum_numerical(53,3,11)
3.80422606518 - 3.80422606518*I
```

level ()

Synonym for modulus.

EXAMPLE:

```
sage: e = DirichletGroup(100, QQ).0
sage: e.level()
100
```

maximize_base_ring ()

Let

$$\varepsilon : (\mathbf{Z}/N\mathbf{Z})^* \to \mathbf{Q}(\zeta_n)$$

be a Dirichlet character. This function returns an equal Dirichlet character

$$\chi : (\mathbf{Z}/N\mathbf{Z})^* \to \mathbf{Q}(\zeta_m)$$

where m is the least common multiple of n and the exponent of $(\mathbf{Z}/N\mathbf{Z})^*$.

EXAMPLES:

```
sage: G.<a,b> = DirichletGroup(20,QQ)
sage: b.maximize_base_ring()
[1, -1]
sage: b.maximize_base_ring().base_ring()
Cyclotomic Field of order 4 and degree 2
sage: DirichletGroup(20).base_ring()
Cyclotomic Field of order 4 and degree 2
```

minimize_base_ring()

Return a Dirichlet character that equals this one, but over as small a subfield (or subring) of the base ring as possible.

Note: This function is currently only implemented when the base ring is a number field. It's the identity function in characteristic p.

EXAMPLES:

```
sage: G = DirichletGroup(13)
sage: e = DirichletGroup(13).0
sage: e.base_ring()
Cyclotomic Field of order 12 and degree 4
sage: e.minimize_base_ring().base_ring()
Cyclotomic Field of order 12 and degree 4
sage: (e^2).minimize_base_ring().base_ring()
Cyclotomic Field of order 6 and degree 2
sage: (e^3).minimize_base_ring().base_ring()
Cyclotomic Field of order 4 and degree 2
sage: (e^12).minimize_base_ring().base_ring()
Rational Field
```

modulus()

The modulus of this character.

EXAMPLES:

```
sage: e = DirichletGroup(100, QQ).0
sage: e.modulus()
100
sage: e.conductor()
4
```

multiplicative_order()

The order of this character.

EXAMPLES:

```
sage: e = DirichletGroup(100).1
sage: e.order()    # same as multiplicative_order, since group is multiplicative
20
sage: e.multiplicative_order()
20
sage: e = DirichletGroup(100).0
sage: e.multiplicative_order()
2
```

primitive_character()

Returns the primitive character associated to self.

EXAMPLES:

```
sage: e = DirichletGroup(100).0; e
[-1, 1]
sage: e.conductor()
4
```

```
sage: f = e.primitive_character(); f
[-1]
sage: f.modulus()
4
```

restrict(*M*)

Returns the restriction of this character to a Dirichlet character modulo the divisor M of the modulus, which must also be a multiple of the conductor of this character.

EXAMPLES:

```
sage: e = DirichletGroup(100).0
sage: e.modulus()
100
sage: e.conductor()
4
sage: e.restrict(20)
[-1, 1]
sage: e.restrict(4)
[-1]
sage: e.restrict(50)
...
ValueError: conductor(=4) must divide M(=50)
```

values()

Returns a list of the values of this character on each integer between 0 and the modulus.

EXAMPLES:

```
sage: e = DirichletGroup(20)(1)
sage: e.values()
[0, 1, 0, 1, 0, 0, 0, 1, 0, 1, 0, 1, 0, 1, 0, 0, 0, 1, 0, 1]
sage: e = DirichletGroup(20).gen(0)
sage: print e.values()
[0, 1, 0, -1, 0, 0, 0, -1, 0, 1, 0, -1, 0, 1, 0, 0, 0, 1, 0, -1]
sage: e = DirichletGroup(20).gen(1)
sage: e.values()
[0, 1, 0, -zeta4, 0, 0, 0, zeta4, 0, -1, 0, 1, 0, -zeta4, 0, 0, 0, zeta4, 0, -1]
sage: e = DirichletGroup(21).gen(0) ; e.values()
[0, 1, -1, 0, 1, -1, 0, 0, -1, 0, 1, -1, 0, 1, 0, 0, 1, -1, 0, 1, -1]
sage: e = DirichletGroup(21, base_ring=GF(37)).gen(0) ; e.values()
[0, 1, 36, 0, 1, 36, 0, 0, 36, 0, 1, 36, 0, 1, 0, 0, 1, 36, 0, 1, 36]
sage: e = DirichletGroup(21, base_ring=GF(3)).gen(0) ; e.values()
[0, 1, 2, 0, 1, 2, 0, 0, 2, 0, 1, 2, 0, 1, 0, 0, 1, 2, 0, 1, 2]

sage: chi = DirichletGroup(100151, CyclotomicField(10)).0
sage: ls = chi.values() ; ls[0:10]
[0,
1,
-zeta10^3,
-zeta10,
-zeta10,
1,
zeta10^3 - zeta10^2 + zeta10 - 1,
zeta10,
zeta10^3 - zeta10^2 + zeta10 - 1,
zeta10^2]
```

values_on_gens()

Returns a tuple of the values of this character on each of the minimal generators of $(\mathbf{Z}/N\mathbf{Z})^*$, where N is the modulus.

EXAMPLES:

```
sage: e = DirichletGroup(16)([-1, 1])
sage: e.values_on_gens ()
(-1, 1)
```

DirichletGroup(*modulus, base_ring=None, zeta=None, zeta_order=None, names=None, integral=False*)

The group of Dirichlet characters modulo N with values in the subgroup $\langle \zeta_n \rangle$ of the multiplicative group of the `base_ring`. If the base_ring is omitted then we use $\mathbf{Q}(\zeta_n)$, where n is the exponent of $(\mathbf{Z}/N\mathbf{Z})^*$. If ζ is omitted then we compute and use a maximal-order zeta in base_ring, if possible.

INPUT:

- `modulus` - int
- `base_ring` - Ring (optional), where characters take their values (should be an integral domain).
- `zeta` - Element (optional), element of base_ring; zeta is a root of unity
- `zeta_order` - int (optional), the order of zeta
- `names` - ignored (needed so G.... = DirichletGroup(...) notation works)
- `integral` - boolean (default: `False`). If `True`, return the group with base_ring the ring of integers in the smallest choice of CyclotomicField. Ignored if base_ring is not `None`.

OUTPUT:

- `DirichletGroup` - a group of Dirichlet characters.

EXAMPLES:

The default base ring is a cyclotomic field of order the exponent of $(\mathbf{Z}/N\mathbf{Z})^*$.

```
sage: DirichletGroup(20)
Group of Dirichlet characters of modulus 20 over Cyclotomic Field of order 4 and degree 2
```

We create the group of Dirichlet character mod 20 with values in the rational numbers:

```
sage: G = DirichletGroup(20, QQ); G
Group of Dirichlet characters of modulus 20 over Rational Field
sage: G.order()
4
sage: G.base_ring()
Rational Field
```

The elements of G print as lists giving the values of the character on the generators of $(Z/NZ)^*$:

```
sage: list(G)
[[1, 1], [-1, 1], [1, -1], [-1, -1]]
```

Next we construct the group of Dirichlet character mod 20, but with values in Q(zeta_n):

```
sage: G = DirichletGroup(20)
sage: G.list()
[[1, 1], [-1, 1], [1, zeta4], [-1, zeta4], [1, -1], [-1, -1], [1, -zeta4], [-1, -zeta4]]
```

We next compute several invariants of G:

```
sage: G.gens()
([-1, 1], [1, zeta4])
sage: G.unit_gens()
[11, 17]
sage: G.zeta()
zeta4
sage: G.zeta_order()
4
```

In this example we create a Dirichlet character with values in a number field. We have to give zeta, but not its order.

```
sage: R.<x> = PolynomialRing(QQ)
sage: K.<a> = NumberField(x^4 + 1)
sage: G = DirichletGroup(5, K, a); G
Group of Dirichlet characters of modulus 5 over Number Field in a with defining polynomial x^4 +
sage: G.list()
[[1], [a^2], [-1], [-a^2]]

sage: G.<e> = DirichletGroup(13)
sage: loads(G.dumps()) == G
True

sage: G = DirichletGroup(19, GF(5))
sage: loads(G.dumps()) == G
True
```

We compute a Dirichlet group over a large prime field.

```
sage: p = next_prime(10^40)
sage: g = DirichletGroup(19, GF(p)); g
Group of Dirichlet characters of modulus 19 over Finite Field of size 10000000000000000000000000
```

Note that the root of unity has small order, i.e., it is not the largest order root of unity in the field.

```
sage: g.zeta_order()
2

sage: r4 = CyclotomicField(4).ring_of_integers()
sage: G = DirichletGroup(60, r4)
sage: G.gens()
([-1, 1, 1], [1, -1, 1], [1, 1, zeta4])
sage: val = G.gens()[2].values_on_gens()[2] ; val
zeta4
sage: parent(val)
Maximal Order in Cyclotomic Field of order 4 and degree 2
sage: r4.residue_field(r4.ideal(29).factor()[0][0])(val)
17
sage: r4.residue_field(r4.ideal(29).factor()[0][0])(val) * GF(29)(3)
22
sage: r4.residue_field(r4.ideal(29).factor()[0][0])(G.gens()[2].values_on_gens()[2]) * 3
22
sage: parent(r4.residue_field(r4.ideal(29).factor()[0][0])(G.gens()[2].values_on_gens()[2]) * 3)
Residue field of Fractional ideal (-2*zeta4 + 5)
```

```
sage: DirichletGroup(60, integral=True)
Group of Dirichlet characters of modulus 60 over Maximal Order in Cyclotomic Field of order 4 an
sage: parent(DirichletGroup(60, integral=True).gens()[2].values_on_gens()[2])
Maximal Order in Cyclotomic Field of order 4 and degree 2
```

class **DirichletGroup_class**(*modulus, zeta, zeta_order*)

Group of Dirichlet characters modulo N over a given base ring R.

base_extend(*R*)

Returns the Dirichlet group over R obtained by extending scalars, with the same modulus and root of unity as self.

EXAMPLES:

```
sage: G = DirichletGroup(7,QQ); G
Group of Dirichlet characters of modulus 7 over Rational Field
sage: H = G.base_extend(CyclotomicField(6)); H
Group of Dirichlet characters of modulus 7 over Cyclotomic Field of order 6 and degree 2
sage: H.zeta()
-1
sage: G.base_extend(ZZ)
...
TypeError: No coercion map from 'Rational Field' to 'Integer Ring' is defined.
```

change_ring(*R, zeta=None, zeta_order=None*)

Returns the Dirichlet group over R with the same modulus as self.

EXAMPLES:

```
sage: G = DirichletGroup(7,QQ); G
Group of Dirichlet characters of modulus 7 over Rational Field
sage: G.change_ring(CyclotomicField(6))
Group of Dirichlet characters of modulus 7 over Cyclotomic Field of order 6 and degree 2
```

decomposition()

Returns the Dirichlet groups of prime power modulus corresponding to primes dividing modulus.

(Note that if the modulus is 2 mod 4, there will be a "factor" of $(\mathbf{Z}/2\mathbf{Z})^*$, which is the trivial group.)

EXAMPLES:

```
sage: DirichletGroup(20).decomposition()
[
Group of Dirichlet characters of modulus 4 over Cyclotomic Field of order 4 and degree 2,
Group of Dirichlet characters of modulus 5 over Cyclotomic Field of order 4 and degree 2
]
sage: DirichletGroup(20,GF(5)).decomposition()
[
Group of Dirichlet characters of modulus 4 over Finite Field of size 5,
Group of Dirichlet characters of modulus 5 over Finite Field of size 5
]
```

exponent()

Return the exponent of this group.

EXAMPLES:

```
sage: DirichletGroup(20).exponent()
4
sage: DirichletGroup(20,GF(3)).exponent()
2
sage: DirichletGroup(20,GF(2)).exponent()
1
```

```
sage: DirichletGroup(37).exponent()
36
```

galois_orbits(*v=None, reps_only=False, sort=True, check=True*)

Return a list of the Galois orbits of Dirichlet characters in self, or in v if v is not None.

INPUT:

- `v` - (optional) list of elements of self
- `reps_only` - (optional: default False) if True only returns representatives for the orbits.
- `sort` - (optional: default True) whether to sort the list of orbits and the orbits themselves (slightly faster if False).
- `check` - (optional, default: True) whether or not to explicitly coerce each element of v into self.

The Galois group is the absolute Galois group of the prime subfield of Frac(R). If R is not a domain, an error will be raised.

EXAMPLES:

```
sage: DirichletGroup(20).galois_orbits()
[
[[1, 1]],
[[1, zeta4], [1, -zeta4]],
[[1, -1]],
[[-1, 1]],
[[-1, zeta4], [-1, -zeta4]],
[[-1, -1]]
]
sage: DirichletGroup(17, Integers(6), zeta=Integers(6)(5)).galois_orbits()
...
TypeError: Galois orbits only defined if base ring is an integral domain
sage: DirichletGroup(17, Integers(9), zeta=Integers(9)(2)).galois_orbits()
...
TypeError: Galois orbits only defined if base ring is an integral domain
```

gen(*n=0*)

Return the n-th generator of self.

EXAMPLES:

```
sage: G = DirichletGroup(20)
sage: G.gen(0)
[-1, 1]
sage: G.gen(1)
[1, zeta4]
sage: G.gen(2)
...
IndexError: n(=2) must be between 0 and 1

sage: G.gen(-1)
...
IndexError: n(=-1) must be between 0 and 1
```

gens()

Returns generators of self.

EXAMPLES:

```
sage: G = DirichletGroup(20)
sage: G.gens()
([-1, 1], [1, zeta4])
```

integers_mod()
Returns the group of integers $\mathbf{Z}/N\mathbf{Z}$ where N is the modulus of self.
EXAMPLES:

```
sage: G = DirichletGroup(20)
sage: G.integers_mod()
Ring of integers modulo 20
```

modulus()
Returns the modulus of self.
EXAMPLES:

```
sage: G = DirichletGroup(20)
sage: G.modulus()
20
```

ngens()
Returns the number of generators of self.
EXAMPLES:

```
sage: G = DirichletGroup(20)
sage: G.ngens()
2
```

order()
Return the number of elements of self. This is the same as len(self).
EXAMPLES:

```
sage: DirichletGroup(20).order()
8
sage: DirichletGroup(37).order()
36
```

random_element()
Return a random element of self.
The element is computed by multiplying a random power of each generator together, where the power is between 0 and the order of the generator minus 1, inclusive.
EXAMPLES:

```
sage: DirichletGroup(37).random_element()
[zeta36^4]
sage: DirichletGroup(20).random_element()
[-1, 1]
sage: DirichletGroup(60).random_element()
[1, -1, 1]
```

unit_gens()
Returns the minimal generators for the units of $(\mathbf{Z}/N\mathbf{Z})^*$, where N is the modulus of self.
EXAMPLES:

```
sage: DirichletGroup(37).unit_gens()
[2]
sage: DirichletGroup(20).unit_gens()
[11, 17]
sage: DirichletGroup(60).unit_gens()
[31, 41, 37]
sage: DirichletGroup(20,QQ).unit_gens()
[11, 17]
```

zeta()
Returns the chosen root zeta of unity in the base ring R.
EXAMPLES:

```
sage: DirichletGroup(37).zeta()
zeta36
sage: DirichletGroup(20).zeta()
zeta4
sage: DirichletGroup(60).zeta()
zeta4
sage: DirichletGroup(60,QQ).zeta()
-1
sage: DirichletGroup(60, GF(25,'a')).zeta()
2
```

zeta_order()
Returns the order of the chosen root zeta of unity in the base ring R.
EXAMPLES:

```
sage: DirichletGroup(20).zeta_order()
4
sage: DirichletGroup(60).zeta_order()
4
sage: DirichletGroup(60, GF(25,'a')).zeta_order()
4
sage: DirichletGroup(19).zeta_order()
18
```

TrivialCharacter(*N, base_ring=Rational Field*)
Return the trivial character of the given modulus, with values in the given base ring.
EXAMPLE:

```
sage: t = trivial_character(7)
sage: [t(x) for x in [0..20]]
[0, 1, 1, 1, 1, 1, 1, 0, 1, 1, 1, 1, 1, 1, 0, 1, 1, 1, 1, 1, 1]
sage: t(1).parent()
Rational Field
sage: trivial_character(7, Integers(3))(1).parent()
Ring of integers modulo 3
```

is_DirichletCharacter(*x*)
Return True if x is of type DirichletCharacter.
EXAMPLES:

```
sage: from sage.modular.dirichlet import is_DirichletCharacter
sage: is_DirichletCharacter(trivial_character(3))
True
sage: is_DirichletCharacter([1])
False
```

is_DirichletGroup(*x*)
Returns True if x is a Dirichlet group.
EXAMPLES:

```
sage: from sage.modular.dirichlet import is_DirichletGroup
sage: is_DirichletGroup(DirichletGroup(11))
True
```

```
sage: is_DirichletGroup(11)
False
sage: is_DirichletGroup(DirichletGroup(11).0)
False
```

kronecker_character(*d*)

Returns the quadratic Dirichlet character (d/.) of minimal conductor.

EXAMPLES:

```
sage: kronecker_character(97*389*997^2)
[-1, -1]
```

```
sage: a = kronecker_character(1)
sage: b = DirichletGroup(2401,QQ)(a)     # NOTE -- over QQ!
sage: b.modulus()
2401
```

AUTHORS:

- Jon Hanke (2006-08-06)

kronecker_character_upside_down(*d*)

Returns the quadratic Dirichlet character (./d) of conductor d, for d0.

EXAMPLES:

```
sage: kronecker_character_upside_down(97*389*997^2)
[-1, -1, 1]
```

AUTHORS:

- Jon Hanke (2006-08-06)

trivial_character(*N, base_ring=Rational Field*)

Return the trivial character of the given modulus, with values in the given base ring.

EXAMPLE:

```
sage: t = trivial_character(7)
sage: [t(x) for x in [0..20]]
[0, 1, 1, 1, 1, 1, 1, 0, 1, 1, 1, 1, 1, 1, 0, 1, 1, 1, 1, 1, 1]
sage: t(1).parent()
Rational Field
sage: trivial_character(7, Integers(3))(1).parent()
Ring of integers modulo 3
```

47.2 The set $\mathbb{P}^1(\mathbb{Q})$ of cusps

EXAMPLES:

```
sage: Cusps
Set P^1(QQ) of all cusps
```

```
sage: Cusp(oo)
Infinity
```

class Cusp (*a, b=None, parent=None, check=True*)

A cusp.

A cusp is either a rational number or infinity, i.e., an element of the projective line over Q. A Cusp is stored as a pair (a,b), where gcd(a,b)=1 and a,b are of type Integer.

EXAMPLES:

```
sage: a = Cusp(2/3); b = Cusp(oo)
sage: a.parent()
Set P^1(QQ) of all cusps
sage: a.parent() is b.parent()
True
```

apply(*g*)

Return g(self), where g=[a,b,c,d] is a list of length 4, which we view as a linear fractional transformation.

EXAMPLES: Apply the identity matrix:

```
sage: Cusp(0).apply([1,0,0,1])
0
sage: Cusp(0).apply([0,-1,1,0])
Infinity
sage: Cusp(0).apply([1,-3,0,1])
-3
```

denominator()

Return the denominator of the cusp a/b.

EXAMPLES:

```
sage: x=Cusp(6,9); x
2/3
sage: x.denominator()
3
sage: Cusp(oo).denominator()
0
sage: Cusp(-5/10).denominator()
2
```

galois_action(*t, N*)

Suppose this cusp is α, G is a congruence subgroup of level N, and σ is the automorphism in the Galois group of $\mathbf{Q}(\zeta_N)/\mathbf{Q}$ that sends ζ_N to ζ_N^t. Then this function computes a cusp β such that $\sigma([\alpha]) = [\beta]$, where $[\alpha]$ is the equivalence class of α modulo G.

INPUT:

- t – integer that is coprime to N
- N – positive integer (level)

OUTPUT:

- a cusp

EXAMPLES:

```
sage: Cusp(1/10).galois_action(3, 50)
1/170
sage: Cusp(oo).galois_action(3, 50)
Infinity
sage: Cusp(0).galois_action(3, 50)
0
```

Here we compute explicitly the permutations of the action for t=3 on cusps for Gamma0(50):

```
sage: N = 50; t=3; G = Gamma0(N); C = G.cusps()
sage: cl = lambda z: exists(C, lambda y:y.is_gamma0_equiv(z, N))[1]
sage: for i in range(5): print i, t^i, [cl(alpha.galois_action(t^i,N)) for alpha in C]
0 1 [0, 1/25, 1/10, 1/5, 3/10, 2/5, 1/2, 3/5, 7/10, 4/5, 9/10, Infinity]
1 3 [0, 1/25, 7/10, 2/5, 1/10, 4/5, 1/2, 1/5, 9/10, 3/5, 3/10, Infinity]
2 9 [0, 1/25, 9/10, 4/5, 7/10, 3/5, 1/2, 2/5, 3/10, 1/5, 1/10, Infinity]
3 27 [0, 1/25, 3/10, 3/5, 9/10, 1/5, 1/2, 4/5, 1/10, 2/5, 7/10, Infinity]
4 81 [0, 1/25, 1/10, 1/5, 3/10, 2/5, 1/2, 3/5, 7/10, 4/5, 9/10, Infinity]
```

REFERENCES:

•Section 1.3 of Glenn Stevens, "Arithmetic on Modular Curves"

•There is a long comment about our algorithm in the source code for this function.

WARNING: In some cases N must fit in a long long, i.e., there are cases where this algorithm isn't fully implemented.

AUTHORS:

•William Stein, 2009-04-18

is_gamma0_equiv(*other, N, transformation=False*)

Return whether self and other are equivalent modulo the action of $\Gamma_0(N)$ via linear fractional transformations.

INPUT:

•`other` - Cusp

•`N` - an integer (specifies the group Gamma_0(N))

•`transformation` - bool (default: False), if True, also return upper left entry of a matrix in Gamma_0(N) that sends self to other.

OUTPUT:

•`bool` - True if self and other are equivalent

•`integer` - returned only if transformation is True

EXAMPLES:

```
sage: x = Cusp(2,3)
sage: y = Cusp(4,5)
sage: x.is_gamma0_equiv(y, 2)
True
sage: x.is_gamma0_equiv(y, 2, True)
(True, 1)
sage: x.is_gamma0_equiv(y, 3)
False
sage: x.is_gamma0_equiv(y, 3, True)
(False, None)
sage: Cusp(1,0)
Infinity
sage: z = Cusp(1,0)
sage: x.is_gamma0_equiv(z, 3, True)
(True, 2)
```

ALGORITHM: See Proposition 2.2.3 of Cremona's book "Algorithms for Modular Elliptic Curves", or Prop 2.27 of Stein's Ph.D. thesis.

is_gamma1_equiv(*other, N*)

Return whether self and other are equivalent modulo the action of Gamma_1(N) via linear fractional transformations.

INPUT:

•`other` - Cusp

- N - an integer (specifies the group Gamma_1(N))

OUTPUT:

- bool - True if self and other are equivalent
- int - 0, 1 or -1, gives further information about the equivalence: If the two cusps are u1/v1 and u2/v2, then they are equivalent if and only if v1 = v2 (mod N) and u1 = u2 (mod gcd(v1,N)) or v1 = -v2 (mod N) and u1 = -u2 (mod gcd(v1,N)) The sign is +1 for the first and -1 for the second. If the two cusps are not equivalent then 0 is returned.

EXAMPLES:

```
sage: x = Cusp(2,3)
sage: y = Cusp(4,5)
sage: x.is_gamma1_equiv(y,2)
(True, 1)
sage: x.is_gamma1_equiv(y,3)
(False, 0)
sage: z = Cusp(QQ(x) + 10)
sage: x.is_gamma1_equiv(z,10)
(True, 1)
sage: z = Cusp(1,0)
sage: x.is_gamma1_equiv(z, 3)
(True, -1)
sage: Cusp(0).is_gamma1_equiv(oo, 1)
(True, 1)
sage: Cusp(0).is_gamma1_equiv(oo, 3)
(False, 0)
```

is_gamma_h_equiv(*other, G*)

Return a pair (b, t), where b is True or False as self and other are equivalent under the action of G, and t is 1 or -1, as described below.

Two cusps $u1/v1$ and $u2/v2$ are equivalent modulo Gamma_H(N) if and only if $v1 = h * v2 (\mathrm{mod} N)$ and $u1 = h^{(-1)} * u2 (\mathrm{mod} gcd(v1, N))$ or $v1 = -h * v2 (mod N)$ and $u1 = -h^{(-1)} * u2 (\mathrm{mod} gcd(v1, N))$ for some $h \in H$. Then t is 1 or -1 as c and c' fall into the first or second case, respectively.

INPUT:

- other - Cusp
- G - a congruence subgroup Gamma_H(N)

OUTPUT:

- bool - True if self and other are equivalent
- int - -1, 0, 1; extra info

EXAMPLES:

```
sage: x = Cusp(2,3)
sage: y = Cusp(4,5)
sage: x.is_gamma_h_equiv(y,GammaH(13,[2]))
(True, 1)
sage: x.is_gamma_h_equiv(y,GammaH(13,[5]))
(False, 0)
sage: x.is_gamma_h_equiv(y,GammaH(5,[]))
(False, 0)
sage: x.is_gamma_h_equiv(y,GammaH(23,[4]))
(True, -1)
```

Enumerating the cusps for a space of modular symbols uses this function.

```
sage: G = GammaH(25,[6]) ; M = G.modular_symbols() ; M
Modular Symbols space of dimension 11 for Congruence Subgroup Gamma_H(25) with H generated b
```

```
sage: M.cusps()
[37/75, 1/2, 31/125, 1/4, -2/5, 2/5, -1/5, 1/10, -3/10, 1/15, 7/15, 9/20]
sage: len(M.cusps())
12
```

This is always one more than the associated space of weight 2 Eisenstein series.

```
sage: G.dimension_eis(2)
11
sage: M.cuspidal_subspace()
Modular Symbols subspace of dimension 0 of Modular Symbols space of dimension 11 for Congrue
sage: G.dimension_cusp_forms(2)
0
```

is_infinity()

Returns True if this is the cusp infinity.

EXAMPLES:

```
sage: Cusp(3/5).is_infinity()
False
sage: Cusp(1,0).is_infinity()
True
sage: Cusp(0,1).is_infinity()
False
```

numerator()

Return the numerator of the cusp a/b.

EXAMPLES:

```
sage: x=Cusp(6,9); x
2/3
sage: x.numerator()
2
sage: Cusp(oo).numerator()
1
sage: Cusp(-5/10).numerator()
-1
```

class **Cusps_class**()

The set of cusps.

EXAMPLES:

```
sage: C = Cusps; C
Set P^1(QQ) of all cusps
sage: loads(C.dumps()) == C
True
```

47.3 Dimensions of spaces of modular forms

AUTHORS:

- William Stein
- Jordi Quer

ACKNOWLEDGEMENT: The dimension formulas and implementations in this module grew out of a program that Bruce Kaskel wrote (around 1996) in PARI, which Kevin Buzzard subsequently extended. I (William Stein) then

implemented it in C++ for Hecke. I also implemented it in Magma. Also, the functions for dimensions of spaces with nontrivial character are based on a paper (that has no proofs) by Cohen and Oesterle (Springer Lecture notes in math, volume 627, pages 69-78). The formulas for $\Gamma_H(N)$ were found and implemented by Jordi Quer.

The formulas here are more complete than in Hecke or Magma.

Currently the input to each function below is an integer and either a Dirichlet character ε or a finite index subgroup of $\mathrm{SL}_2(\mathbf{Z})$. If the input is a Dirichlet character ε, the dimensions are for subspaces of $M_k(\Gamma_1(N), \varepsilon)$, where N is the modulus of ε.

These functions mostly call the methods dimension_cusp_forms, dimension_modular_forms and so on of the corresponding congruence subgroup classes.

CO_delta(*r, p, N, eps*)

This is used as an intermediate value in computations related to the paper of Cohen-Oesterle.

INPUT:

- `r` - positive integer
- `p` - a prime
- `N` - positive integer
- `eps` - character

OUTPUT: element of the base ring of the character

EXAMPLES:

```
sage: G.<eps> = DirichletGroup(7)
sage: sage.modular.dims.CO_delta(1,5,7,eps^3)
2
```

CO_nu(*r, p, N, eps*)

This is used as an intermediate value in computations related to the paper of Cohen-Oesterle.

INPUT:

- `r` - positive integer
- `p` - a prime
- `N` - positive integer
- `eps` - character

OUTPUT: element of the base ring of the character

EXAMPLES:

```
sage: G.<eps> = DirichletGroup(7)
sage: G.<eps> = DirichletGroup(7)
sage: sage.modular.dims.CO_nu(1,7,7,eps)
-1
```

CohenOesterle(*eps, k*)

Compute the Cohen-Oesterle function associate to eps, k. This is a summand in the formula for the dimension of the space of cusp forms of weight 2 with character ε.

INPUT:

- `eps` - Dirichlet character
- `k` - integer

OUTPUT: element of the base ring of eps.

EXAMPLES:

```
sage: G.<eps> = DirichletGroup(7)
sage: sage.modular.dims.CohenOesterle(eps, 2)
-2/3
sage: sage.modular.dims.CohenOesterle(eps, 4)
-1
```

dimension_cusp_forms(*X, k=2*)

The dimension of the space of cusp forms for the given congruence subgroup or Dirichlet character.

INPUT:

- X - congruence subgroup or Dirichlet character or integer
- k - weight (integer)

EXAMPLES:

```
sage: dimension_cusp_forms(5,4)
1

sage: dimension_cusp_forms(Gamma0(11),2)
1
sage: dimension_cusp_forms(Gamma1(13),2)
2

sage: dimension_cusp_forms(DirichletGroup(13).0^2,2)
1
sage: dimension_cusp_forms(DirichletGroup(13).0,3)
1

sage: dimension_cusp_forms(Gamma0(11),2)
1
sage: dimension_cusp_forms(Gamma0(11),0)
0
sage: dimension_cusp_forms(Gamma0(1),12)
1
sage: dimension_cusp_forms(Gamma0(1),2)
0
sage: dimension_cusp_forms(Gamma0(1),4)
0

sage: dimension_cusp_forms(Gamma0(389),2)
32
sage: dimension_cusp_forms(Gamma0(389),4)
97
sage: dimension_cusp_forms(Gamma0(2005),2)
199
sage: dimension_cusp_forms(Gamma0(11),1)
0

sage: dimension_cusp_forms(Gamma1(11),2)
1
sage: dimension_cusp_forms(Gamma1(1),12)
1
sage: dimension_cusp_forms(Gamma1(1),2)
0
```

```
sage: dimension_cusp_forms(Gamma1(1),4)
0

sage: dimension_cusp_forms(Gamma1(389),2)
6112
sage: dimension_cusp_forms(Gamma1(389),4)
18721
sage: dimension_cusp_forms(Gamma1(2005),2)
159201

sage: dimension_cusp_forms(Gamma1(11),1)
0

sage: e = DirichletGroup(13).0
sage: e.order()
12
sage: dimension_cusp_forms(e,2)
0
sage: dimension_cusp_forms(e^2,2)
1
```

dimension_eis(*X, k=2*)

The dimension of the space of Eisenstein series for the given congruence subgroup.

INPUT:

- X - congruence subgroup or Dirichlet character or integer
- k - weight (integer)

EXAMPLES:

```
sage: dimension_eis(5,4)
2

sage: dimension_eis(Gamma0(11),2)
1
sage: dimension_eis(Gamma1(13),2)
11
sage: dimension_eis(Gamma1(2006),2)
3711

sage: e = DirichletGroup(13).0
sage: e.order()
12
sage: dimension_eis(e,2)
0
sage: dimension_eis(e^2,2)
2

sage: e = DirichletGroup(13).0
sage: e.order()
12
sage: dimension_eis(e,2)
0
sage: dimension_eis(e^2,2)
2
```

```
sage: dimension_eis(e,13)
2

sage: G = DirichletGroup(20)
sage: dimension_eis(G.0,3)
4
sage: dimension_eis(G.1,3)
6
sage: dimension_eis(G.1^2,2)
6

sage: G = DirichletGroup(200)
sage: e = prod(G.gens(), G(1))
sage: e.conductor()
200
sage: dimension_eis(e,2)
4

sage: dimension_modular_forms(Gamma1(4), 11)
6
```

dimension_modular_forms(*X, k=2*)

The dimension of the space of cusp forms for the given congruence subgroup (either $\Gamma_0(N)$, $\Gamma_1(N)$, or $\Gamma_H(N)$) or Dirichlet character.

INPUT:

- X - congruence subgroup or Dirichlet character
- k - weight (integer)

EXAMPLES:

```
sage: dimension_modular_forms(Gamma0(11),2)
2
sage: dimension_modular_forms(Gamma0(11),0)
1
sage: dimension_modular_forms(Gamma1(13),2)
13
sage: dimension_modular_forms(GammaH(11, [10]), 2)
10
sage: dimension_modular_forms(GammaH(11, [10]))
10
sage: dimension_modular_forms(GammaH(11, [10]), 4)
20
sage: e = DirichletGroup(20).1
sage: dimension_modular_forms(e,3)
9
sage: dimension_cusp_forms(e,3)
3
sage: dimension_eis(e,3)
6
sage: dimension_modular_forms(11,2)
2
```

dimension_new_cusp_forms(*X, k=2, p=0*)

Return the dimension of the new (or p-new) subspace of cusp forms for the character or group X.

INPUT:

- X - integer, congruence subgroup or Dirichlet character
- k - weight (integer)
- p - 0 or a prime

EXAMPLES:

```
sage: dimension_new_cusp_forms(100,2)
1

sage: dimension_new_cusp_forms(Gamma0(100),2)
1
sage: dimension_new_cusp_forms(Gamma0(100),4)
5

sage: dimension_new_cusp_forms(Gamma1(100),2)
141
sage: dimension_new_cusp_forms(Gamma1(100),4)
463

sage: dimension_new_cusp_forms(DirichletGroup(100).1^2,2)
2
sage: dimension_new_cusp_forms(DirichletGroup(100).1^2,4)
8

sage: sum(dimension_new_cusp_forms(e,3) for e in DirichletGroup(30))
12
sage: dimension_new_cusp_forms(Gamma1(30),3)
12
```

eisen(*p*)

Return the Eisenstein number n which is the numerator of $(p-1)/12$.

INPUT:

- p - a prime

OUTPUT: Integer

EXAMPLES:

```
sage: [(p,sage.modular.dims.eisen(p)) for p in prime_range(24)]
[(2, 1), (3, 1), (5, 1), (7, 1), (11, 5), (13, 1), (17, 4), (19, 3), (23, 11)]
```

sturm_bound(*level, weight=2*)

Returns the Sturm bound for modular forms with given level and weight. For more details, see the documentation for the sturm_bound method of sage.modular.arithgroup.CongruenceSubgroup objects.

INPUT:

- level - an integer (interpreted as a level for Gamma0) or a congruence subgroup
- weight - an integer ≥ 2 (default: 2)

EXAMPLES:

```
sage: sturm_bound(11,2)
2
sage: sturm_bound(389,2)
65
sage: sturm_bound(1,12)
1
sage: sturm_bound(100,2)
30
sage: sturm_bound(1,36)
3
sage: sturm_bound(11)
2
```

47.4 Conjectural Slopes of Hecke Polynomial

Interface to Kevin Buzzard's PARI program for computing conjectural slopes of characteristic polynomials of Hecke operators.

AUTHORS:

- William Stein (2006-03-05): Sage interface
- Kevin Buzzard: PARI program that implements underlying functionality

buzzard_tpslopes(*p, N, kmax*)

Returns a vector of length kmax, whose k'th entry ($0 \leq k \leq k_{max}$) is the conjectural sequence of valuations of eigenvalues of T_p on forms of level N, weight k, and trivial character.

This conjecture is due to Kevin Buzzard, and is only made assuming that p does not divide N and if p is $\Gamma_0(N)$-regular.

EXAMPLES:

```
sage: c = buzzard_tpslopes(2,1,50)
sage: c[50]
[4, 8, 13]
```

Hence Buzzard would conjecture that the 2-adic valuations of the eigenvalues of T_2 on cusp forms of level 1 and weight 50 are $[4, 8, 13]$, which indeed they are, as one can verify by an explicit computation using, e.g., modular symbols:

```
sage: M = ModularSymbols(1,50, sign=1).cuspidal_submodule()
sage: T = M.hecke_operator(2)
sage: f = T.charpoly('x')
sage: f.newton_slopes(2)
[13, 8, 4]
```

AUTHORS:

- Kevin Buzzard: several GP/PARI scripts
- William Stein (2006-03-17): small Sage wrapper of Buzzard's scripts

gp()

Return a copy of the GP interpreter with the appropriate files loaded.

EXAMPLE:

```
sage: sage.modular.buzzard.gp()
GP/PARI interpreter
```

47.5 Eta-products on modular curves $X_0(N)$.

This package provides a class for representing eta-products, which are meromorphic functions on modular curves of the form

$$\prod_{d|N} \eta(q^d)^{r_d}$$

where $\eta(q)$ is Dirichlet's eta function $q^{1/24}\prod_{n=1}^{\infty}(1-q^n)$. These are useful for obtaining explicit models of modular curves.

See trac ticket #3934 for background.

AUTHOR:

- David Loeffler (2008-08-22): initial version

AllCusps(*N*)

Return a list of CuspFamily objects corresponding to the cusps of $X_0(N)$.

INPUT:

- N - (integer): the level

EXAMPLES:

```
sage: AllCusps(18)
[(Inf), (c_{2}), (c_{3,1}), (c_{3,2}), (c_{6,1}), (c_{6,2}), (c_{9}), (0)]
```

class CuspFamily(*N, width, label=None*)

A family of elliptic curves parametrising a region of $X_0(N)$.

level()

The level of this cusp.

EXAMPLES:

```
sage: e = CuspFamily(10, 1)
sage: e.level()
10
```

sage_cusp()

Return the corresponding element of $\mathbb{P}^1(\mathbf{Q})$.

EXAMPLE:

```
sage: CuspFamily(10, 1).sage_cusp() # not implemented
Infinity
```

width()

The width of this cusp.

EXAMPLES:

```
sage: e = CuspFamily(10, 1)
sage: e.width()
1
```

EtaGroup(*level*)

Create the group of eta products of the given level.

EXAMPLES:

```
sage: EtaGroup(12)
Group of eta products on X_0(12)
sage: EtaGroup(1/2)
...
TypeError: Level (=1/2) must be a positive integer
sage: EtaGroup(0)
...
ValueError: Level (=0) must be a positive integer
```

class EtaGroupElement(*parent, rdict*)

degree()

Return the degree of self as a map $X_0(N) \to \mathbb{P}^1$, which is equal to the sum of all the positive coefficients in the divisor of self.

EXAMPLES:

```
sage: e = EtaProduct(12, {1:-336, 2:576, 3:696, 4:-216, 6:-576, 12:-144})
sage: e.degree()
230
```

divisor()

Return the divisor of self, as a formal sum of CuspFamily objects.

EXAMPLES:

```
sage: e = EtaProduct(12, {1:-336, 2:576, 3:696, 4:-216, 6:-576, 12:-144})
sage: e.divisor() # FormalSum seems to print things in a random order?
-131*(Inf) - 50*(c_{2}) + 11*(0) + 50*(c_{6}) + 169*(c_{4}) - 49*(c_{3})
sage: e = EtaProduct(2^8, {8:1,32:-1})
sage: e.divisor() # random
-(c_{2}) - (Inf) - (c_{8,2}) - (c_{8,3}) - (c_{8,4}) - (c_{4,2}) - (c_{8,1}) - (c_{4,1}) + (
```

level()

Return the level of this eta product.

EXAMPLES:

```
sage: e = EtaProduct(3, {3:12, 1:-12})
sage: e.level()
3
sage: EtaProduct(12, {6:6, 2:-6}).level() # not the lcm of the d's
12
sage: EtaProduct(36, {6:6, 2:-6}).level() # not minimal
36
```

order_at_cusp(*cusp*)

Return the order of vanishing of self at the given cusp.

INPUT:

- `cusp` - a CuspFamily object

OUTPUT:

- an integer

EXAMPLES:

```
sage: e = EtaProduct(2, {2:24, 1:-24})
sage: e.order_at_cusp(CuspFamily(2, 1)) # cusp at infinity
1
sage: e.order_at_cusp(CuspFamily(2, 2)) # cusp 0
-1
```

q_expansion(*n*)

The q-expansion of self at the cusp at infinity.

INPUT:

- n (integer): number of terms to calculate

OUTPUT:

- a power series over **Z** in the variable q, with a *relative* precision of $1 + O(q^n)$.

ALGORITHM: Calculates eta to (n/m) terms, where m is the smallest integer dividing self.level() such that self.r(m) != 0. Then multiplies.

EXAMPLES:

```
sage: EtaProduct(36, {6:6, 2:-6}).q_expansion(10)
q + 6*q^3 + 27*q^5 + 92*q^7 + 279*q^9 + O(q^11)
sage: R.<q> = ZZ[[]]
sage: EtaProduct(2,{2:24,1:-24}).q_expansion(100) == delta_qexp(101)(q^2)/delta_qexp(101)(q)
True
```

qexp(*n*)

Alias for `self.q_expansion()`.

EXAMPLES:

```
sage: e = EtaProduct(36, {6:8, 3:-8})
sage: e.qexp(10)
q + 8*q^4 + 36*q^7 + O(q^10)
sage: e.qexp(30) == e.q_expansion(30)
True
```

r(*d*)

Return the exponent r_d of $\eta(q^d)$ in self.

EXAMPLES:

```
sage: e = EtaProduct(12, {2:24, 3:-24})
sage: e.r(3)
-24
sage: e.r(4)
0
```

class **EtaGroup_class**(*level*)

The group of eta products of a given level under multiplication.

basis(*reduce=True*)

Produce a basis for the free abelian group of eta-products of level N (under multiplication), attempting to find basis vectors of the smallest possible degree.

INPUT:

- `reduce` - a boolean (default True) indicating whether or not to apply LLL-reduction to the calculated basis

EXAMPLE:

```
sage: EtaGroup(5).basis()
[Eta product of level 5 : (eta_1)^6 (eta_5)^-6]
sage: EtaGroup(12).basis()
```

```
[Eta product of level 12 : (eta_1)^2 (eta_2)^1 (eta_3)^2 (eta_4)^-1 (eta_6)^-7 (eta_12)^3,
Eta product of level 12 : (eta_1)^-2 (eta_2)^3 (eta_3)^6 (eta_4)^-1 (eta_6)^-9 (eta_12)^3,
Eta product of level 12 : (eta_1)^-3 (eta_2)^2 (eta_3)^1 (eta_4)^-1 (eta_6)^-2 (eta_12)^3,
Eta product of level 12 : (eta_1)^1 (eta_2)^-1 (eta_3)^-3 (eta_4)^-2 (eta_6)^7 (eta_12)^-2,
Eta product of level 12 : (eta_1)^-6 (eta_2)^9 (eta_3)^2 (eta_4)^-3 (eta_6)^-3 (eta_12)^1]
sage: EtaGroup(12).basis(reduce=False) # much bigger coefficients
[Eta product of level 12 : (eta_2)^24 (eta_12)^-24,
Eta product of level 12 : (eta_1)^-336 (eta_2)^576 (eta_3)^696 (eta_4)^-216 (eta_6)^-576 (et
Eta product of level 12 : (eta_1)^-8 (eta_2)^-2 (eta_6)^2 (eta_12)^8,
Eta product of level 12 : (eta_1)^1 (eta_2)^9 (eta_3)^13 (eta_4)^-4 (eta_6)^-15 (eta_12)^-4,
Eta product of level 12 : (eta_1)^15 (eta_2)^-24 (eta_3)^-29 (eta_4)^9 (eta_6)^24 (eta_12)^5
```

ALGORITHM: An eta product of level N is uniquely determined by the integers r_d for $d|N$ with $d < N$, since $\sum_{d|N} r_d = 0$. The valid r_d are those that satisfy two congruences modulo 24, and one congruence modulo 2 for every prime divisor of N. We beef up the congruences modulo 2 to congruences modulo 24 by multiplying by 12. To calculate the kernel of the ensuing map $\mathbf{Z}^m \to (\mathbf{Z}/24\mathbf{Z})^n$ we lift it arbitrarily to an integer matrix and calculate its Smith normal form. This gives a basis for the lattice.

This lattice typically contains "large" elements, so by default we pass it to the reduce_basis() function which performs LLL-reduction to give a more manageable basis.

level()

Return the level of self. EXAMPLES:

```
sage: EtaGroup(10).level()
10
```

reduce_basis(*long_etas*)

Produce a more manageable basis via LLL-reduction.

INPUT:

- `long_etas` - a list of EtaGroupElement objects (which should all be of the same level)

OUTPUT:

- a new list of EtaGroupElement objects having hopefully smaller norm

ALGORITHM: We define the norm of an eta-product to be the L^2 norm of its divisor (as an element of the free $\mathbf{Z}$-module with the cusps as basis and the standard inner product). Applying LLL-reduction to this gives a basis of hopefully more tractable elements. Of course we'd like to use the L^1 norm as this is just twice the degree, which is a much more natural invariant, but L^2 norm is easier to work with!

EXAMPLES:

```
sage: EtaGroup(4).reduce_basis([ EtaProduct(4, {1:8,2:24,4:-32}), EtaProduct(4, {1:8, 4:-8})
[Eta product of level 4 : (eta_1)^8 (eta_4)^-8,
Eta product of level 4 : (eta_1)^-8 (eta_2)^24 (eta_4)^-16]
```

EtaProduct(*level, dict*)

Create an EtaGroupElement object representing the function $\prod_{d|N} \eta(q^d)^{r_d}$. Checks the criteria of Ligozat to ensure that this product really is the q-expansion of a meromorphic function on X_0(N).

INPUT:

- `level` - (integer): the N such that this eta product is a function on X_0(N).
- `dict` - (dictionary): a dictionary indexed by divisors of N such that the coefficient of $\eta(q^d)$ is r[d]. Only nonzero coefficients need be specified. If Ligozat's criteria are not satisfied, a ValueError will be raised.

OUTPUT:

- an EtaGroupElement object, whose parent is the EtaGroup of level N and whose coefficients are the given dictionary.

Note: The dictionary dict does not uniquely specify N. It is possible for two EtaGroupElements with different N's to be created with the same dictionary, and these represent different objects (although they will have the same q-expansion at the cusp ∞).

EXAMPLES:

```
sage: EtaProduct(3, {3:12, 1:-12})
Eta product of level 3 : (eta_1)^-12 (eta_3)^12
sage: EtaProduct(3, {3:6, 1:-6})
...
ValueError: sum d r_d (=12) is not 0 mod 24
sage: EtaProduct(3, {4:6, 1:-6})
...
ValueError: 4 does not divide 3
```

eta_poly_relations(*eta_elements, degree, labels=, ['x1', 'x2'], verbose=False*)

Find polynomial relations between eta products.

INPUTS:

- `eta_elements` - (list): a list of EtaGroupElement objects. Not implemented unless this list has precisely two elements. degree
- `degree` - (integer): the maximal degree of polynomial to look for.
- `labels` - (list of strings): labels to use for the polynomial returned.
- `verbose ` - (boolean, default False): if True, prints information as it goes.

OUTPUTS: a list of polynomials which is a Groebner basis for the part of the ideal of relations between eta_elements which is generated by elements up to the given degree; or None, if no relations were found.

ALGORITHM: An expression of the form $\sum_{0\le i,j\le d} a_{ij}x^iy^j$ is zero if and only if it vanishes at the cusp infinity to degree at least $v = d(deg(x)+deg(y))$. For all terms up to q^v in the q-expansion of this expression to be zero is a system of $v+k$ linear equations in d^2 coefficients, where k is the number of nonzero negative coefficients that can appear.

Solving these equations and calculating a basis for the solution space gives us a set of polynomial relations, but this is generally far from a minimal generating set for the ideal, so we calculate a Groebner basis.

As a test, we calculate five extra terms of q-expansion and check that this doesn't change the answer.

EXAMPLES:

```
sage: t = EtaProduct(26, {2:2,13:2,26:-2,1:-2})
sage: u = EtaProduct(26, {2:4,13:2,26:-4,1:-2})
sage: eta_poly_relations([t, u], 3)
sage: eta_poly_relations([t, u], 4)
[x1^3*x2 - 13*x1^3 - 4*x1^2*x2 - 4*x1*x2 - x2^2 + x2]
```

Use verbose=True to see the details of the computation:

```
sage: eta_poly_relations([t, u], 3, verbose=True)
Trying to find a relation of degree 3
Lowest order of a term at infinity = -12
Highest possible degree of a term = 15
Trying all coefficients from q^-12 to q^15 inclusive
No polynomial relation of order 3 valid for 28 terms
Check: Trying all coefficients from q^-12 to q^20 inclusive
No polynomial relation of order 3 valid for 33 terms
```

```
sage: eta_poly_relations([t, u], 4, verbose=True)
Trying to find a relation of degree 4
Lowest order of a term at infinity = -16
Highest possible degree of a term = 20
Trying all coefficients from q^-16 to q^20 inclusive
Check: Trying all coefficients from q^-16 to q^25 inclusive
[x1^3*x2 - 13*x1^3 - 4*x1^2*x2 - 4*x1*x2 - x2^2 + x2]
```

num_cusps_of_width(*N, d*)

Return the number of cusps on $X_0(N)$ of width d.

INPUT:

- N - (integer): the level
- d - (integer): an integer dividing N, the cusp width

EXAMPLES:

```
sage: [num_cusps_of_width(18,d) for d in divisors(18)]
[1, 1, 2, 2, 1, 1]
```

qexp_eta(*ps_ring, n*)

Return the q-expansion of $\eta(q)/q^{1/24}$, where $\eta(q)$ is Dedekind's function

$$\eta(q) = q^{1/24}\prod_{i=1}^{\infty}(1-q^i)$$

as an element of ps_ring, to precision n. Completely naive algorithm.

INPUT:

- ps_ring - (PowerSeriesRing): a power series ring - we pass this as an argument as we frequently need to create multiple series in the same ring.
- n - (integer): the number of terms to compute.

OUTPUT: An element of ps_ring which is the q-expansion of $\eta(q)/q^{1/24}$ truncated to n terms.

ALGORITHM: Multiply out the product $\prod_{i=1}^{n}(1-q^i)$. Could perhaps be sped-up by using the identity

$$\eta(q) = q^{1/24}(1+\sum_{i\geq 1}(-1)^n(q^{n(3n+1)/2}+q^{n(3n-1)/2}),$$

but I'm lazy.

EXAMPLES:

```
sage: qexp_eta(ZZ[['q']], 100)
1 - q - q^2 + q^5 + q^7 - q^12 - q^15 + q^22 + q^26 - q^35 - q^40 + q^51 + q^57 - q^70 - q^77 +
```

47.6 The space of p-adic weights

A p-adic weight is a continuous character $\mathbf{Z}_p^\times \to \mathbf{C}_p^\times$. These are the $\mathbf{C}_p$-points of a rigid space over $\mathbf{Q}_p$, which is isomorphic to a disjoint union of copies (indexed by $(\mathbf{Z}/p\mathbf{Z})^\times$) of the open unit p-adic disc.

Sage supports both "classical points", which are determined by the data of a Dirichlet character modulo p^m for some m and an integer k (corresponding to the character $z \mapsto z^k\chi(z)$) and "non-classical points" which are determined by the data of an element of $(\mathbf{Z}/p\mathbf{Z})^\times$ and an element $w \in \mathbf{C}_p$ with $|w-1| < 1$.

EXAMPLES:

```
sage: W = pAdicWeightSpace(17)
sage: W
Space of 17-adic weight-characters defined over '17-adic Field with capped relative precision 20'
sage: L = Qp(17).extension(x^2 - 17, names='a'); L.rename('L')
sage: W.base_extend(L)
Space of 17-adic weight-characters defined over 'L'
```

We create a simple element of $\mathcal{W}$: the algebraic character, $x \mapsto x^6$:

```
sage: kappa = W(6)
sage: kappa(5)
15625
sage: kappa(5) == 5^6
True
```

A locally algebraic character, $x \mapsto x^6\chi(x)$ for χ a Dirichlet character mod p:

```
sage: kappa2 = W(6, DirichletGroup(17, Qp(17)).0^8)
sage: kappa2(5) == -5^6
True
sage: kappa2(13) == 13^6
True
```

A non-locally-algebraic character, sending the generator 18 of $1 + 17\mathbf{Z}_{17}$ to 35 and acting as $\mu \mapsto \mu^4$ on the group of 16th roots of unity:

```
sage: kappa3 = W(35 + O(17^20), 4, algebraic=False)
sage: kappa3(2)
16 + 8*17 + ... + O(17^20)
```

AUTHORS:

- David Loeffler (2008-9)

class **AlgebraicWeight** (*parent, k, chi=None*)

A point in weight space corresponding to a locally algebraic character, of the form $x \mapsto \chi(x)x^k$ where k is an integer and χ is a Dirichlet character modulo p^n for some n.

TESTS:

```
sage: w = pAdicWeightSpace(23)(12, DirichletGroup(23, QQ).0) # exact
sage: w == loads(dumps(w))
True
sage: w = pAdicWeightSpace(23)(12, DirichletGroup(23, Qp(23)).0) # inexact
sage: w == loads(dumps(w))
True
sage: w is loads(dumps(w)) # elements are not globally unique
False
```

Lvalue()

Return the value of the p-adic L-function of $\mathbf{Q}$ evaluated at this weight-character. If the character is $x \mapsto x^k\chi(x)$ where $k > 0$ and χ has conductor a power of p, this is an element of the number field generated by the values of χ, equal to the value of the complex L-function $L(1-k, \chi)$. If χ is trivial, it is equal to $(1 - p^{k-1})\zeta(1-k)$.

At present this is not implemented in any other cases, except the trivial character (for which the value is ∞).

TODO: Implement this more generally using the Amice transform machinery in sage/schemes/elliptic_curves/padic_lseries.py, which should clearly be factored out into a separate class.

EXAMPLES:

```
sage: pAdicWeightSpace(7)(4).Lvalue() == (1 - 7^3)*zeta__exact(-3)
True
sage: pAdicWeightSpace(7)(5, DirichletGroup(7, Qp(7)).0^4).Lvalue()
0
sage: pAdicWeightSpace(7)(6, DirichletGroup(7, Qp(7)).0^4).Lvalue()
1 + 2*7 + 7^2 + 3*7^3 + 3*7^5 + 4*7^6 + 2*7^7 + 5*7^8 + 2*7^9 + 3*7^10 + 6*7^11 + 2*7^12 + 3
```

chi()

If this character is $x \mapsto x^k\chi(x)$ for an integer k and a Dirichlet character χ, return χ.

EXAMPLE:

```
sage: kappa = pAdicWeightSpace(29)(13, DirichletGroup(29, Qp(29)).0^14)
sage: kappa.chi()
[28 + 28*29 + 28*29^2 + ... + O(29^20)]
```

k()

If this character is $x \mapsto x^k\chi(x)$ for an integer k and a Dirichlet character χ, return k.

EXAMPLE:

```
sage: kappa = pAdicWeightSpace(29)(13, DirichletGroup(29, Qp(29)).0^14)
sage: kappa.k()
13
```

teichmuller_type()

Return the Teichmuller type of this weight-character κ, which is the unique $t \in \mathbf{Z}/(p-1)\mathbf{Z}$ such that $\kappa(\mu) = \mu^t$ for mu a $(p-1)$-st root of 1.

For $p = 2$ this doesn't make sense, but we still want the Teichmuller type to correspond to the index of the component of weight space in which κ lies, so we return 1 if κ is odd and 0 otherwise.

EXAMPLE:

```
sage: pAdicWeightSpace(11)(2, DirichletGroup(11,QQ).0).teichmuller_type()
7
sage: pAdicWeightSpace(29)(13, DirichletGroup(29, Qp(29)).0).teichmuller_type()
14
sage: pAdicWeightSpace(2)(3, DirichletGroup(4,QQ).0).teichmuller_type()
0
```

class **ArbitraryWeight**(*parent, w, t*)

teichmuller_type()

Return the Teichmuller type of this weight-character κ, which is the unique $t \in \mathbf{Z}/(p-1)\mathbf{Z}$ such that $\kappa(\mu) = \mu^t$ for mu a $(p-1)$-st root of 1.

For $p = 2$ this doesn't make sense, but we still want the Teichmuller type to correspond to the index of the component of weight space in which κ lies, so we return 1 if κ is odd and 0 otherwise.

EXAMPLES:

```
sage: pAdicWeightSpace(17)(1 + 3*17 + 2*17^2 + O(17^3), 8, False).teichmuller_type()
8
sage: pAdicWeightSpace(2)(1 + 2 + O(2^2), 1, False).teichmuller_type()
1
```

class **WeightCharacter**(*parent*)

Abstract base class representing an element of the p-adic weight space $Hom(\mathbf{Z}_p^\times, \mathbf{C}_p^\times)$.

Lvalue()

Return the value of the p-adic L-function of $\mathbf{Q}$, which can be regarded as a rigid-analytic function on weight space, evaluated at this character.

EXAMPLES:

```
sage: W = pAdicWeightSpace(11)
sage: sage.modular.overconvergent.weightspace.WeightCharacter(W).Lvalue()
...
NotImplementedError
```

base_extend(*R*)

Extend scalars to the base ring R (which must have a canonical map from the current base ring)

EXAMPLE:

```
sage: w = pAdicWeightSpace(17, QQ)(3)
sage: w.base_extend(Qp(17))
3
```

is_even()

Return True if this weight-character sends -1 to +1.

EXAMPLE:

```
sage: pAdicWeightSpace(17)(0).is_even()
True
sage: pAdicWeightSpace(17)(11).is_even()
False
sage: pAdicWeightSpace(17)(1 + 17 + O(17^20), 3, False).is_even()
False
sage: pAdicWeightSpace(17)(1 + 17 + O(17^20), 4, False).is_even()
True
```

is_trivial()

Return True if and only if this is the trivial character.

EXAMPLES:

```
sage: pAdicWeightSpace(11)(2).is_trivial()
False
sage: pAdicWeightSpace(11)(2, DirichletGroup(11, QQ).0).is_trivial()
False
sage: pAdicWeightSpace(11)(0).is_trivial()
True
```

one_over_Lvalue()

Return the reciprocal of the p-adic L-function evaluated at this weight-character. If the weight-character is odd, then the L-function is zero, so an error will be raised.

EXAMPLES:

```
sage: pAdicWeightSpace(11)(4).one_over_Lvalue()
-12/133
sage: pAdicWeightSpace(11)(3, DirichletGroup(11, QQ).0).one_over_Lvalue()
-1/6
sage: pAdicWeightSpace(11)(3).one_over_Lvalue()
...
ZeroDivisionError: Rational division by zero
sage: pAdicWeightSpace(11)(0).one_over_Lvalue()
0
sage: type(_)
<type 'sage.rings.integer.Integer'>
```

pAdicEisensteinSeries(*ring, prec=20*)

Calculate the q-expansion of the p-adic Eisenstein series of given weight-character, normalised so the constant term is 1.

EXAMPLE:

```
sage: kappa = pAdicWeightSpace(3)(3, DirichletGroup(3,QQ).0)
sage: kappa.pAdicEisensteinSeries(QQ[['q']], 20)
1 - 9*q + 27*q^2 - 9*q^3 - 117*q^4 + 216*q^5 + 27*q^6 - 450*q^7 + 459*q^8 - 9*q^9 - 648*q^10
```

values_on_gens()

If κ is this character, calculate the values $(\kappa(r), t)$ where r is $1 + p$ (or 5 if $p = 2$) and t is the unique element of $\mathbf{Z}/(p-1)\mathbf{Z}$ such that $\kappa(\mu) = \mu^t$ for μ a (p-1)st root of unity. (If $p = 2$, we take t to be 0 or 1 according to whether κ is odd or even.) These two values uniquely determine the character κ.

EXAMPLES:

```
sage: W=pAdicWeightSpace(11); W(2).values_on_gens()
(1 + 2*11 + 11^2 + O(11^20), 2)
sage: W(2, DirichletGroup(11, QQ).0).values_on_gens()
(1 + 2*11 + 11^2 + O(11^20), 7)
sage: W(1 + 2*11 + O(11^5), 4, algebraic = False).values_on_gens()
(1 + 2*11 + O(11^5), 4)
```

class **WeightSpace_class**(*p, base_ring*)

The space of p-adic weight-characters $\mathcal{W} = \mathrm{Hom}(\mathbf{Z}_p^\times, \mathbf{C}_p^\times)$. This isomorphic to a disjoint union of $(p-1)$ open discs of radius 1 (or 2 such discs if $p = 2$), with the parameter on the open disc corresponding to the image of $1 + p$ (or 5 if $p = 2$)

TESTS:

```
sage: W = pAdicWeightSpace(3)
sage: W is loads(dumps(W))
True
```

base_extend(*R*)

Extend scalars to the ring R. There must be a canonical coercion map from the present base ring to R.

EXAMPLE:

```
sage: W = pAdicWeightSpace(3, QQ)
sage: W.base_extend(Qp(3))
Space of 3-adic weight-characters defined over '3-adic Field with capped relative precision
sage: W.base_extend(IntegerModRing(12))
...
TypeError: No coercion map from 'Rational Field' to 'Ring of integers modulo 12' is defined
```

prime()

Return the prime p such that this is a p-adic weight space.

EXAMPLE:

```
sage: pAdicWeightSpace(17).prime()
17
```

WeightSpace_constructor(*p, base_ring=None*)

Construct the p-adic weight space for the given prime p. A p-adic weight is a continuous character $\mathbf{Z}_p^\times \to \mathbf{C}_p^\times$. These are the $\mathbf{C}_p$-points of a rigid space over $\mathbf{Q}_p$, which is isomorphic to a disjoint union of copies (indexed by $(\mathbf{Z}/p\mathbf{Z})^\times$) of the open unit p-adic disc.

Note that the "base ring" of a p-adic weight is the smallest ring containing the image of $\mathbf{Z}$; in particular, although the default base ring is $\mathbf{Q}_p$, base ring $\mathbf{Q}$ will also work.

EXAMPLES:

```
sage: pAdicWeightSpace(3) # indirect doctest
Space of 3-adic weight-characters defined over '3-adic Field with capped relative precision 20'
sage: pAdicWeightSpace(3, QQ)

47.7 Overconvergent p-adic modular forms for small primes

This module implements computations of the U_p-operator on overconvergent modular forms of level $\Gamma_0(p)$, where p is one of the primes $\{2, 3, 5, 7, 13\}$, using the algorithms described in:

David Loeffler, "Spectral expansions of overconvergent modular functions", Int. Math. Res. Not 2007(050).

AUTHORS:

- David Loeffler (August 2008): initial version

class **OverconvergentModularFormElement** (*parent, gexp=None, qexp=None*)

A class representing an element of a space of overconvergent modular forms.

EXAMPLE:

```
sage: K.<w> = Qp(5).extension(x^7 - 5); s = OverconvergentModularForms(5, 6, 1/21, base_ring=K).
sage: s == loads(dumps(s))
True
```

additive_order()

Return the additive order of this element (required attribute for all elements deriving from sage.modules.ModuleElement)

EXAMPLES:

```
sage: M = OverconvergentModularForms(13, 10, 1/2, base_ring = Qp(13).extension(x^2 - 13,name
sage: M.gen(0).additive_order()
+Infinity
sage: M(0).additive_order()
1
```

base_extend(*R*)

Return a copy of self but with coefficients in the given ring.

EXAMPLES:

```
sage: M = OverconvergentModularForms(7, 10, 1/2, prec=5)
sage: f = M.1
sage: f.base_extend(Qp(7, 4))
7-adic overconvergent modular form of weight-character 10 with q-expansion (7 + O(7^5))*q +
```

eigenvalue()

Return the U_p-eigenvalue of this eigenform. Raises an error unless this element was explicitly flagged as an eigenform, using the _notify_eigen function.

EXAMPLE:

```
sage: M = OverconvergentModularForms(3, 0, 1/2)
sage: f = M.eigenfunctions(3)[1]
sage: f.eigenvalue()
```

```
3^2 + 3^4 + 2*3^6 + 3^7 + 3^8 + 2*3^9 + 2*3^10 + 3^12 + 3^16 + 2*3^17 + 3^18 + 3^20 + 2*3^21
sage: M.gen(4).eigenvalue()
...
TypeError: eigenvalue only defined for eigenfunctions
```

gexp()

Return the formal power series in g corresponding to this overconvergent modular form (so the result is F where this modular form is $E_k^* \times F(g)$, where g is the appropriately normalised parameter of $X_0(p)$).

EXAMPLE:

```
sage: M = OverconvergentModularForms(3, 0, 1/2)
sage: f = M.eigenfunctions(3)[1]
sage: f.gexp()
(3^-3 + O(3^91))*g + (3^-1 + 1 + 2*3 + 3^2 + 2*3^3 + 3^5 + 3^7 + 3^10 + 3^11 + 3^14 + 3^15 +
```

governing_term(*r*)

The degree of the series term with largest norm on the r-overconvergent region.

EXAMPLES:

```
sage: o=OverconvergentModularForms(3, 0, 1/2)
sage: f=o.eigenfunctions(10)[1]
sage: f.governing_term(1/2)
1
```

is_eigenform()

Return True if this is an eigenform. At present this returns False unless this element was explicitly flagged as an eigenform, using the _notify_eigen function.

EXAMPLE:

```
sage: M = OverconvergentModularForms(3, 0, 1/2)
sage: f = M.eigenfunctions(3)[1]
sage: f.is_eigenform()
True
sage: M.gen(4).is_eigenform()
False
```

is_integral()

Test whether or not this element has q-expansion coefficients that are p-adically integral. This should always be the case with eigenfunctions, but sometimes if n is very large this breaks down for unknown reasons!

EXAMPLE:

```
sage: M = OverconvergentModularForms(2, 0, 1/3)
sage: q = QQ[['q']].gen()
sage: M(q - 17*q^2 + O(q^3)).is_integral()
True
sage: M(q - q^2/2 + 6*q^7  + O(q^9)).is_integral()
False
```

prec()

Return the series expansion precision of this overconvergent modular form. (This is not the same as the p-adic precision of the coefficients.)

EXAMPLE:

```
sage: OverconvergentModularForms(5, 6, 1/3,prec=15).gen(1).prec()
15
```

prime()

If this is a p-adic modular form, return p.

EXAMPLE:

```
sage: OverconvergentModularForms(2, 0, 1/2).an_element().prime()
2
```

qexp()
Return the q-expansion of self, to as high precision as it is known.
EXAMPLE:

```
sage: OverconvergentModularForms(3, 4, 1/2).gen(0).qexp()
1 - 120/13*q - 1080/13*q^2 - 120/13*q^3 - 8760/13*q^4 - 15120/13*q^5 - 1080/13*q^6 - 41280/1
```

r_ord(*r*)
The p-adic valuation of self on the r-overconvergent region.
EXAMPLES:

```
sage: o=OverconvergentModularForms(3, 0, 1/2)
sage: t = o([1, 1, 1/3])
sage: t.r_ord(1/2)
1
sage: t.r_ord(2/3)
3
```

slope()
Return the slope of this eigenform, i.e. the valuation of its U_p-eigenvalue. Raises an error unless this element was explicitly flagged as an eigenform, using the _notify_eigen function.
EXAMPLE:

```
sage: M = OverconvergentModularForms(3, 0, 1/2)
sage: f = M.eigenfunctions(3)[1]
sage: f.slope()
2
sage: M.gen(4).slope()
...
TypeError: slope only defined for eigenfunctions
```

valuation_plot()
Draw a graph depicting the growth of the norm of this overconvergent modular form as it approaches the boundary of the overconvergent region.
EXAMPLE:

```
sage: o=OverconvergentModularForms(3, 0, 1/2)
sage: f=o.eigenfunctions(4)[1]
sage: f.valuation_plot()
```

weight()
Return the weight of this overconvergent modular form.
EXAMPLES:

```
sage: M = OverconvergentModularForms(13, 10, 1/2, base_ring = Qp(13).extension(x^2 - 13,name
sage: M.gen(0).weight()
10
```

OverconvergentModularForms(*prime, weight, radius, base_ring=Rational Field, prec=20, char=None*)
Create a space of overconvergent p-adic modular forms of level $\Gamma_0(p)$, over the given base ring. The base ring need not be a p-adic ring (the spaces we compute with typically have bases over $\mathbf{Q}$).

INPUT:

- `prime` - a prime number p, which must be one of the primes $\{2, 3, 5, 7, 13\}$, or the congruence subgroup Gamma0(p) where p is one of these primes.

- `weight` - an integer (which at present must be 0 or ≥ 2), the weight.
- `radius` - a rational number in the interval $\left(0, \frac{p}{p+1}\right)$, the radius of overconvergence.
- `base_ring` (default: $\mathbf{Q}$), a ring over which to compute. This need not be a p-adic ring.
- `prec` - an integer (default: 20), the number of q-expansion terms to compute.
- `char` - a Dirichlet character modulo p or `None` (the default). Here `None` is interpreted as the trivial character modulo p.

The character χ and weight k must satisfy $(-1)^k = \chi(-1)$, and the base ring must contain an element v such that $\mathrm{ord}_p(v) = \frac{12r}{p-1}$ where r is the radius of overconvergence (and ord_p is normalised so $\mathrm{ord}_p(p) = 1$).

EXAMPLES:

```
sage: OverconvergentModularForms(3, 0, 1/2)
Space of 3-adic 1/2-overconvergent modular forms of weight-character 0 over Rational Field
sage: OverconvergentModularForms(3, 16, 1/2)
Space of 3-adic 1/2-overconvergent modular forms of weight-character 16 over Rational Field
sage: OverconvergentModularForms(3, 3, 1/2, char = DirichletGroup(3,QQ).0)
Space of 3-adic 1/2-overconvergent modular forms of weight-character (3, 3, [-1]) over Rational
```

class `OverconvergentModularFormsSpace` (*prime, weight, radius, base_ring, prec, char*)

A space of overconvergent modular forms of level $\Gamma_0(p)$, where p is a prime such that $X_0(p)$ has genus 0.

Elements are represented as power series, with a formal power series F corresponding to the modular form $E_k^* \times F(g)$ where E_k^* is the p-deprived Eisenstein series of weight-character k, and g is a uniformiser of $X_0(p)$ normalised so that the r-overconvergent region $X_0(p)_{\geq r}$ corresponds to $|g| \leq 1$.

TESTS:

```
sage: K.<w> = Qp(13).extension(x^2-13); M = OverconvergentModularForms(13, 20, radius=1/2, base_
sage: M is loads(dumps(M))
True
```

`base_extend`(*ring*)

Return the base extension of self to the given base ring. There must be a canonical map to this ring from the current base ring, otherwise a TypeError will be raised.

EXAMPLES:

```
sage: M = OverconvergentModularForms(2, 0, 1/2, base_ring = Qp(2))
sage: M.base_extend(Qp(2).extension(x^2 - 2, names="w"))
Space of 2-adic 1/2-overconvergent modular forms of weight-character 0 over Eisenstein Exten
sage: M.base_extend(QQ)
...
TypeError: Base extension of self (over '2-adic Field with capped relative precision 20') to
```

`change_ring`(*ring*)

Return the space corresponding to self but over the given base ring.

EXAMPLES:

```
sage: M = OverconvergentModularForms(2, 0, 1/2)
sage: M.change_ring(Qp(2))
Space of 2-adic 1/2-overconvergent modular forms of weight-character 0 over 2-adic Field wit
```

`character`()

Return the character of self. For overconvergent forms, the weight and the character are unified into the concept of a weight-character, so this returns exactly the same thing as self.weight().

EXAMPLE:

```
sage: OverconvergentModularForms(3, 0, 1/2).character()
0
sage: type(OverconvergentModularForms(3, 0, 1/2).character())
<class '...weightspace.AlgebraicWeight'>
sage: OverconvergentModularForms(3, 3, 1/2, char=DirichletGroup(3,QQ).0).character()
(3, 3, [-1])
```

coordinate_vector(*x*)

Write x as a vector with respect to the basis given by self.basis(). Here x must be an element of this space or something that can be converted into one. If x has precision less than the default precision of self, then the returned vector will be shorter.

EXAMPLES:

```
sage: M = OverconvergentModularForms(Gamma0(3), 0, 1/3, prec=4)
sage: M.coordinate_vector(M.gen(2))
(0, 0, 1, 0)
sage: q = QQ[['q']].gen(); M.coordinate_vector(q - q^2 + O(q^4))
(0, 1/9, -13/81, 74/243)
sage: M.coordinate_vector(q - q^2 + O(q^3))
(0, 1/9, -13/81)
```

cps_u(*n, use_recurrence=False*)

Compute the characteristic power series of U_p acting on self, using an n x n matrix.

EXAMPLES:

```
sage: OverconvergentModularForms(3, 16, 1/2, base_ring=Qp(3)).cps_u(4)
1 + O(3^20) + (2 + 2*3 + 2*3^2 + 2*3^4 + 3^5 + 3^6 + 3^7 + 3^11 + 3^12 + 2*3^14 + 3^16 + 3^1
sage: OverconvergentModularForms(3, 16, 1/2, base_ring=Qp(3), prec=30).cps_u(10)
1 + O(3^20) + (2 + 2*3 + 2*3^2 + 2*3^4 + 3^5 + 3^6 + 3^7 + 2*3^15 + O(3^16))*T + (2*3^3 + 3^
```

eigenfunctions(*n, F=None, exact_arith=True*)

Calculate approximations to eigenfunctions of self. These are the eigenfunctions of self.hecke_matrix(p, n), which are approximations to the true eigenfunctions. Returns a list of OverconvergentModularFormElement objects, in increasing order of slope.

INPUT:

- `n` - integer. The size of the matrix to use.
- `F` - None, or a field over which to calculate eigenvalues. If the field is None, the current base ring is used. If the base ring is not a p-adic ring, an error will be raised.
- `exact_arith` - True or False (default True). If True, use exact rational arithmetic to calculate the matrix of the U operator and its characteristic power series, even when the base ring is an inexact p-adic ring. This is typically slower, but more numerically stable.

NOTE: Try using `set_verbose(1, 'sage/modular/overconvergent')` to get more feedback on what is going on in this algorithm. For even more feedback, use 2 instead of 1.

EXAMPLES:

```
sage: X = OverconvergentModularForms(2, 2, 1/6).eigenfunctions(8, Qp(2, 100))
sage: X[1]
2-adic overconvergent modular form of weight-character 2 with q-expansion (1 + O(2^36))*q +
sage: [x.slope() for x in X]
[0, 4, 8, 14, 16, 18, 26, 30]
```

gen(*i*)

Return the ith module generator of self.

EXAMPLE:

```
sage: M = OverconvergentModularForms(3, 2, 1/2, prec=4)
sage: M.gen(0)
3-adic overconvergent modular form of weight-character 2 with q-expansion 1 + 12*q + 36*q^2
sage: M.gen(1)
3-adic overconvergent modular form of weight-character 2 with q-expansion 27*q + 648*q^2 + 7
sage: M.gen(30)
3-adic overconvergent modular form of weight-character 2 with q-expansion O(q^4)
```

gens()

Return a generator object that iterates over the (infinite) set of basis vectors of self.

EXAMPLES:

```
sage: o = OverconvergentModularForms(3, 12, 1/2)
sage: t = o.gens()
sage: t.next()
3-adic overconvergent modular form of weight-character 12 with q-expansion 1 - 32760/612039
sage: t.next()
3-adic overconvergent modular form of weight-character 12 with q-expansion 27*q + 1982919301
```

gens_dict()

Return a dictionary mapping the names of generators of this space to their values. (Required by parent class definition.) As this does not make any sense here, this raises a TypeError.

EXAMPLES:

```
sage: M = OverconvergentModularForms(2, 4, 1/6)
sage: M.gens_dict()
...
TypeError: gens_dict does not make sense as number of generators is infinite
```

hecke_matrix(*m, n, use_recurrence=False, exact_arith=False*)

Calculate the matrix of the T_m operator in the basis of this space, truncated to an $n \times n$ matrix. Conventions are that operators act on the left on column vectors (this is the opposite of the conventions of the sage.modules.matrix_morphism class!) Uses naive q-expansion arguments if use_recurrence=False and uses the Kolberg style recurrences if use_recurrence=True.

The argument "exact_arith" causes the computation to be done with rational arithmetic, even if the base ring is an inexact p-adic ring. This is useful as there can be precision loss issues (particularly with use_recurrence=False).

EXAMPLES:

```
sage: OverconvergentModularForms(2, 0, 1/2).hecke_matrix(2, 4)
[    1     0     0     0]
[    0    24    64     0]
[    0    32  1152  4608]
[    0     0  3072 61440]
sage: OverconvergentModularForms(2, 12, 1/2, base_ring=pAdicField(2)).hecke_matrix(2, 3) * (
[        1 + O(2^2)                  0                  0]
[                 0       2^3 + O(2^5)       2^6 + O(2^8)]
[                 0       2^4 + O(2^6) 2^7 + 2^8 + O(2^9)]
sage: OverconvergentModularForms(2, 12, 1/2, base_ring=pAdicField(2)).hecke_matrix(2, 3, exa
[                            1                             0
[                            0              33881928/1414477                             6
[                            0 -192898739923312/2000745183529            1626332544/141447
```

hecke_operator(*f, m*)

Given an element f and an integer m, calculates the Hecke operator T_m acting on f.

The input may be either a "bare" power series, or an OverconvergentModularFormElement object; the return value will be of the same type.

EXAMPLE:

```
sage: M = OverconvergentModularForms(3, 0, 1/2)
sage: f = M.1
sage: M.hecke_operator(f, 3)
3-adic overconvergent modular form of weight-character 0 with q-expansion 2430*q + 265356*q^
sage: M.hecke_operator(f.qexp(), 3)
2430*q + 265356*q^2 + 10670373*q^3 + 249948828*q^4 + 4113612864*q^5 + 52494114852*q^6 + O(q^
```

is_exact()

True if elements of this space are represented exactly, i.e., there is no precision loss when doing arithmetic. As this is never true for overconvergent modular forms spaces, this returns False.

EXAMPLES:

```
sage: OverconvergentModularForms(13, 12, 0).is_exact()
False
```

ngens()

The number of generators of self (as a module over its base ring), i.e. infinity.

EXAMPLES:

```
sage: M = OverconvergentModularForms(2, 4, 1/6)
sage: M.ngens()
+Infinity
```

normalising_factor()

The normalising factor c such that $g = cf$ is a parameter for the r-overconvergent disc in $X_0(p)$, where f is the standard uniformiser.

EXAMPLE:

```
sage: L.<w> = Qp(7).extension(x^2 - 7)
sage: OverconvergentModularForms(7, 0, 1/4, base_ring=L).normalising_factor()
w + O(w^41)
```

prec()

Return the series precision of self. Note that this is different from the p-adic precision of the base ring.

EXAMPLE:

```
sage: OverconvergentModularForms(3, 0, 1/2).prec()
20
sage: OverconvergentModularForms(3, 0, 1/2,prec=40).prec()
40
```

prime()

Return the residue characteristic of self, i.e. the prime p such that this is a p-adic space.

EXAMPLES:

```
sage: OverconvergentModularForms(5, 12, 1/3).prime()
5
```

radius()

The radius of overconvergence of this space.

EXAMPLE:

```
sage: OverconvergentModularForms(3, 0, 1/3).radius()
1/3
```

recurrence_matrix(*use_smithline=True*)

Return the recurrence matrix satisfied by the coefficients of U, that is a matrix $R = (r_{rs})_{r,s=1\ldots p}$ such that $u_{ij} = \sum_{r,s=1}^{p} r_{rs} u_{i-r,j-s}$. Uses an elegant construction which I believe is due to Smithline. See my paper in IMRN (full citation in reference manual).

EXAMPLES:

```
sage: OverconvergentModularForms(2, 0, 0).recurrence_matrix()
[  48    1]
[4096    0]
sage: OverconvergentModularForms(2, 0, 1/2).recurrence_matrix()
[48 64]
[64  0]
sage: OverconvergentModularForms(3, 0, 0).recurrence_matrix()
[   270     36      1]
[ 26244    729      0]
[531441      0      0]
sage: OverconvergentModularForms(5, 0, 0).recurrence_matrix()
[     1575      1300       315        30         1]
[   162500     39375      3750       125         0]
[  4921875    468750     15625         0         0]
[ 58593750   1953125         0         0         0]
[244140625         0         0         0         0]
sage: OverconvergentModularForms(7, 0, 0).recurrence_matrix()
[       4018        8624        5915        1904         322          28           1]
[     422576      289835       93296       15778        1372          49           0]
[   14201915     4571504      773122       67228        2401           0           0]
[  224003696    37882978     3294172      117649           0           0           0]
[ 1856265922   161414428     5764801           0           0           0           0]
[ 7909306972   282475249           0           0           0           0           0]
[13841287201           0           0           0           0           0           0]
sage: OverconvergentModularForms(13, 0, 0).recurrence_matrix()
[         15145         124852         354536 ...
```

slopes(*n, use_recurrence=False*)

Compute the slopes of the U_p operator acting on self, using an n x n matrix.

EXAMPLES:: sage: OverconvergentModularForms(5,2,1/3,base_ring=Qp(5),prec=100).slopes(5) [0, 2, 5, 6, 9] sage: OverconvergentModularForms(2,1,1/3,char=DirichletGroup(4,QQ).0).slopes(5) [0, 2, 4, 6, 8]

weight()

Return the character of self. For overconvergent forms, the weight and the character are unified into the concept of a weight-character, so this returns exactly the same thing as self.character().

EXAMPLE:

```
sage: OverconvergentModularForms(3, 0, 1/2).weight()
0
sage: type(OverconvergentModularForms(3, 0, 1/2).weight())
<class '...weightspace.AlgebraicWeight'>
sage: OverconvergentModularForms(3, 3, 1/2, char=DirichletGroup(3,QQ).0).weight()
(3, 3, [-1])
```

47.8 Module of Supersingular Points

The module of divisors on the modular curve $X_0(N)$ over F_p supported at supersingular points.

AUTHORS:

- William Stein
- David Kohel
- Iftikhar Burhanuddin

EXAMPLES:

```
sage: x = SupersingularModule(389)
sage: m = x.T(2).matrix()
sage: a = m.change_ring(GF(97))
sage: D = a.decomposition()
sage: D[:3]
[
(Vector space of degree 33 and dimension 1 over Finite Field of size 97
Basis matrix:
[ 0  0  0  1 96 96  1 96 96  0  2 96 96  0  1  0  1  2 95  0  1  1  0  1  0 95  0 96 95  1 96  0  2],
(Vector space of degree 33 and dimension 1 over Finite Field of size 97
Basis matrix:
[ 0  1 96 75 16 81 22 17 17  0  0 80 80  1 16 40 74  0  0 96 81 23 57 74  0  0  0 24  0 23 73  0  0],
(Vector space of degree 33 and dimension 1 over Finite Field of size 97
Basis matrix:
[ 0  1 96 90 90  7  7  6 91  0  0 91  6 13  7  0 91  0  0 84 90  6  0  6  0  0  0 90  0 91  7  0  0],
]
sage: len(D)
9
```

We compute a Hecke operator on a space of huge dimension!:

```
sage: X = SupersingularModule(next_prime(100000))
sage: t = X.T(2).matrix()            # long time (but still less than a minute!)
sage: t.nrows()                      # long time
8334
```

TESTS:

```
sage: X = SupersingularModule(389)
sage: T = X.T(2).matrix().change_ring(QQ)
sage: d = T.decomposition()
sage: len(d)
6
sage: [a[0].dimension() for a in d]
[1, 1, 2, 3, 6, 20]
sage: loads(dumps(X)) == X
True
sage: loads(dumps(d)) == d
True
```

Phi2_quad(*J3, ssJ1, ssJ2*)

This function returns a certain quadratic polynomial over a finite field in indeterminate J3.

The roots of the polynomial along with ssJ1 are the neighboring/2-isogenous supersingular j-invariants of ssJ2.

INPUT:

- `J3` – indeterminate of a univariate polynomial ring defined over a finite field with p^2 elements where p is a prime number
- `ssJ2`, `ssJ2` – supersingular j-invariants over the finite field

OUTPUT:

- polynomial – defined over the finite field

EXAMPLES: The following code snippet produces a factor of the modular polynomial $\Phi_2(x, j_{in})$, where j_{in} is a supersingular j-invariant defined over the finite field with 37^2 elements:

```
sage: F = GF(37^2, 'a')
sage: X = PolynomialRing(F, 'x').gen()
sage: j_in = supersingular_j(F)
sage: poly = sage.modular.ssmod.ssmod.Phi_polys(2,X,j_in)
sage: poly.roots()
[(8, 1), (27*a + 23, 1), (10*a + 20, 1)]
sage: sage.modular.ssmod.ssmod.Phi2_quad(X, F(8), j_in)
x^2 + 31*x + 31
```

Note: Given a root (j1,j2) to the polynomial $Phi_2(J1, J2)$, the pairs (j2,j3) not equal to (j2,j1) which solve $Phi_2(j2, j3)$ are roots of the quadratic equation:

J3^2 + (-j2^2 + 1488*j2 + (j1 - 162000))*J3 + (-j1 + 1488)*j2^2 + (1488*j1 + 40773375)*j2 + j1^2 - 162000*j1 + 8748000000

This will be of use to extend the 2-isogeny graph, once the initial three roots are determined for $Phi_2(J1, J2)$.

AUTHORS:

- David Kohel – kohel@maths.usyd.edu.au
- Iftikhar Burhanuddin – burhanud@usc.edu

Phi_polys(*L, x, j*)

This function returns a certain polynomial of degree $L + 1$ in the indeterminate x over a finite field.

The roots of the **modular** polynomial $\Phi(L, x, j)$ are the L-isogenous supersingular j-invariants of j.

INPUT:

- `L` – integer, either 2,3,5,7 or 11
- `x` – indeterminate of a univariate polynomial ring defined over a finite field with p^2 elements, where p is a prime number
- `j` – supersingular j-invariant over the finite field

OUTPUT:

- polynomial – defined over the finite field

EXAMPLES: The following code snippet produces the modular polynomial $\Phi_L(x, j_{in})$, where j_{in} is a supersingular j-invariant defined over the finite field with 7^2 elements:

```
sage: F = GF(7^2, 'a')
sage: X = PolynomialRing(F, 'x').gen()
sage: j_in = supersingular_j(F)
sage: sage.modular.ssmod.ssmod.Phi_polys(2,X,j_in)
x^3 + 3*x^2 + 3*x + 1
sage: sage.modular.ssmod.ssmod.Phi_polys(3,X,j_in)
x^4 + 4*x^3 + 6*x^2 + 4*x + 1
sage: sage.modular.ssmod.ssmod.Phi_polys(5,X,j_in)
x^6 + 6*x^5 + x^4 + 6*x^3 + x^2 + 6*x + 1
sage: sage.modular.ssmod.ssmod.Phi_polys(7,X,j_in)
x^8 + x^7 + x + 1
sage: sage.modular.ssmod.ssmod.Phi_polys(11,X,j_in)
x^12 + 5*x^11 + 3*x^10 + 3*x^9 + 5*x^8 + x^7 + x^5 + 5*x^4 + 3*x^3 + 3*x^2 + 5*x + 1
```

- William Stein – wstein@gmail.com
- David Kohel – kohel@maths.usyd.edu.au
- Iftikhar Burhanuddin – burhanud@usc.edu

class SupersingularModule(*prime=2, level=1, base_ring=Integer Ring*)

The module of supersingular points in a given characteristic, with given level structure.

The characteristic must not divide the level.

NOTE: Currently, only level 1 is implemented.

EXAMPLES:

```
sage: S = SupersingularModule(17)
sage: S
Module of supersingular points on X_0(1)/F_17 over Integer Ring
sage: S = SupersingularModule(16)
...
ValueError: the argument prime must be a prime number
sage: S = SupersingularModule(prime=17, level=34)
...
ValueError: the argument level must be coprime to the argument prime
sage: S = SupersingularModule(prime=17, level=5)
...
NotImplementedError: supersingular modules of level > 1 not yet implemented
```

dimension()

Return the dimension of the space of modular forms of weight 2 and level equal to the level associated to self.

INPUT:

- `self` – SupersingularModule object

OUTPUT: integer – dimension, nonnegative

EXAMPLES:

```
sage: S = SupersingularModule(7)
sage: S.dimension()
1

sage: S = SupersingularModule(15073)
sage: S.dimension()
1256

sage: S = SupersingularModule(83401)
sage: S.dimension()
6950
```

NOTES: The case of level > 1 has not yet been implemented.

AUTHORS:

- David Kohel – kohel@maths.usyd.edu.au
- Iftikhar Burhanuddin – burhanud@usc.edu

hecke_matrix(*L*)

This function returns the Lth Hecke matrix.

INPUT:

- `self` – SupersingularModule object
- `L` – integer, positive

OUTPUT: matrix – sparse integer matrix

EXAMPLES: This example computes the action of the Hecke operator T_2 on the module of supersingular points on $X_0(1)/F_{37}$:

```
sage: S = SupersingularModule(37)
sage: M = S.hecke_matrix(2)
sage: M
[1 1 1]
[1 0 2]
[1 2 0]
```

This example computes the action of the Hecke operator T_3 on the module of supersingular points on $X_0(1)/F_{67}$:

```
sage: S = SupersingularModule(67)
sage: M = S.hecke_matrix(3)
sage: M
[0 0 0 0 2 2]
[0 0 1 1 1 1]
[0 1 0 2 0 1]
[0 1 2 0 1 0]
[1 1 0 1 0 1]
[1 1 1 0 1 0]
```

Note: The first list — list_j — returned by the supersingular_points function are the rows *and* column indexes of the above hecke matrices and its ordering should be kept in mind when interpreting these matrices.

AUTHORS:

- David Kohel – kohel@maths.usyd.edu.au
- Iftikhar Burhanuddin – burhanud@usc.edu

level()

This function returns the level associated to self.

INPUT:

- `self` – SupersingularModule object

OUTPUT: integer – the level, positive

EXAMPLES:

```
sage: S = SupersingularModule(15073)
sage: S.level()
1
```

AUTHORS:

- David Kohel – kohel@maths.usyd.edu.au
- Iftikhar Burhanuddin – burhanud@usc.edu

prime()

This function returns the characteristic of the finite field associated to self.

INPUT:

- `self` – SupersingularModule object

OUTPUT:

- integer – characteristic, positive

EXAMPLES:

```
sage: S = SupersingularModule(19)
sage: S.prime()
19
```

AUTHORS:

- David Kohel – kohel@maths.usyd.edu.au

•Iftikhar Burhanuddin – burhanud@usc.edu

rank()

Return the dimension of the space of modular forms of weight 2 and level equal to the level associated to self.

INPUT:

•`self` – SupersingularModule object

OUTPUT: integer – dimension, nonnegative

EXAMPLES:

```
sage: S = SupersingularModule(7)
sage: S.dimension()
1

sage: S = SupersingularModule(15073)
sage: S.dimension()
1256

sage: S = SupersingularModule(83401)
sage: S.dimension()
6950
```

NOTES: The case of level > 1 has not yet been implemented.

AUTHORS:

•David Kohel – kohel@maths.usyd.edu.au

•Iftikhar Burhanuddin – burhanud@usc.edu

supersingular_points()

This function computes the supersingular j-invariants over the finite field associated to self.

INPUT:

•`self` – SupersingularModule object

OUTPUT: list_j, dict_j – list_j is the list of supersingular j-invariants, dict_j is a dictionary with these j-invariants as keys and their indexes as values. The latter is used to speed up j-invariant look-up. The indexes are based on the order of their *discovery*.

EXAMPLES:

The following examples calculate supersingular j-invariants over finite fields with characteristic 7, 11 and 37:

```
sage: S = SupersingularModule(7)
sage: S.supersingular_points()
([6], {6: 0})

sage: S = SupersingularModule(11)
sage: S.supersingular_points()
([1, 0], {0: 1, 1: 0})

sage: S = SupersingularModule(37)
sage: S.supersingular_points()
([8, 27*a + 23, 10*a + 20], {8: 0, 10*a + 20: 2, 27*a + 23: 1})
```

AUTHORS:

•David Kohel – kohel@maths.usyd.edu.au

•Iftikhar Burhanuddin – burhanud@usc.edu

upper_bound_on_elliptic_factors(*p=None, ellmax=2*)

Return an upper bound (provably correct) on the number of elliptic curves of conductor equal to the level of this supersingular module.

INPUT:

- p - (default: 997) prime to work modulo

ALGORITHM: Currently we only use T_2. Function will be extended to use more Hecke operators later.

The prime p is replaced by the smallest prime that doesn't divide the level.

EXAMPLE:

```
sage: SupersingularModule(37).upper_bound_on_elliptic_factors()
2
```

(There are 4 elliptic curves of conductor 37, but only 2 isogeny classes.)

weight()

This function returns the weight associated to self.

INPUT:

- self – SupersingularModule object

OUTPUT: integer – weight, positive

EXAMPLES:

```
sage: S = SupersingularModule(19)
sage: S.weight()
2
```

AUTHORS:

- David Kohel – kohel@maths.usyd.edu.au
- Iftikhar Burhanuddin – burhanud@usc.edu

dimension_supersingular_module(*prime, level=1*)

This function returns the dimension of the Supersingular module, which is equal to the dimension of the space of modular forms of weight 2 and conductor equal to prime times level.

INPUT:

- prime – integer, prime
- level – integer, positive

OUTPUT: dimension – integer, nonnegative

EXAMPLES: The code below computes the dimensions of Supersingular modules with level=1 and prime = 7, 15073 and 83401:

```
sage: dimension_supersingular_module(7)
1

sage: dimension_supersingular_module(15073)
1256

sage: dimension_supersingular_module(83401)
6950
```

NOTES: The case of level > 1 has not been implemented yet.

AUTHORS:

- David Kohel – kohel@maths.usyd.edu.au

•Iftikhar Burhanuddin - burhanud@usc.edu

supersingular_D(*prime*)

This function returns a fundamental discriminant D of an imaginary quadratic field, where the given prime does not split (see Silverman's Advanced Topics in the Arithmetic of Elliptic Curves, page 184, exercise 2.30(d).)

INPUT:

•prime – integer, prime

OUTPUT: D – integer, negative

EXAMPLES:

These examples return *supersingular discriminants* for 7, 15073 and 83401:

```
sage: supersingular_D(7)
-4

sage: supersingular_D(15073)
-15

sage: supersingular_D(83401)
-7
```

AUTHORS:

•David Kohel - kohel@maths.usyd.edu.au

•Iftikhar Burhanuddin - burhanud@usc.edu

supersingular_j(*FF*)

This function returns a supersingular j-invariant over the finite field FF.

INPUT:

•FF – finite field with p^2 elements, where p is a prime number

OUTPUT: finite field element – a supersingular j-invariant defined over the finite field FF

EXAMPLES:

The following examples calculate supersingular j-invariants for a few finite fields:

```
sage: supersingular_j(GF(7^2, 'a'))
6
```

Observe that in this example the j-invariant is not defined over the prime field:

```
sage: supersingular_j(GF(15073^2,'a'))  # optional -- requires database
10630*a + 6033

sage: supersingular_j(GF(83401^2, 'a'))
67977
```

47.9 Brandt Modules

AUTHORS:

- Jon Bober

- William Stein
- Gonzalo Tornaria

47.9.1 Introduction

This tutorial outlines the construction of Brandt modules in Sage. The importance of this construction is that it provides us with a method to compute modular forms on $\Gamma_0(N)$ as outlined in Pizer's paper [Pi]. In fact there exists a non-canonical Hecke algebra isomorphism between the Brandt modules and a certain subspace of $S_2(\Gamma_0(pM))$ which contains all the newforms.

The Brandt module is the free abelian group on right ideal classes of a quaternion order together with a natural Hecke action determined by Brandt matrices.

Quaternion Algebras

A quaternion algebra over $\mathbf{Q}$ is a central simple algebra of dimension 4 over $\mathbf{Q}$. Such an algebra A is said to be ramified at a place v of $\mathbf{Q}$ if and only if $A_v = A \otimes \mathbf{Q}_v$ is a division algebra. Otherwise A is said to be split at v.

`A = QuaternionAlgebra(p)` returns the quaternion algebra A over $\mathbf{Q}$ ramified precisely at the places p and ∞.

`A = QuaternionAlgebra(k,a,b)` returns a quaternion algebra with basis $\{1, i, j, j\}$ over $\mathbb{K}$ such that $i^2 = a$, $j^2 = b$ and $ij = k$.

An order R in a quaternion algebra is a 4-dimensional lattice on A which is also a subring containing the identity.

`R = A.maximal_order()` returns a maximal order R in the quaternion algebra A.

An Eichler order $\mathcal{O}$ in a quaternion algebra is the intersection of two maximal orders. The level of $\mathcal{O}$ is its index in any maximal order containing it.

`O = A.order_of_level_N` returns an Eichler order $\mathcal{O}$ in A of level N where p does not divide N.

A right $\mathcal{O}$-ideal I is a lattice on A such that $I_p = a_p\mathcal{O}$ (for some $a_p \in A_p^*$) for all $p < \infty$. Two right $\mathcal{O}$-ideals I and J are said to belong to the same class if $I = aJ$ for some $a \in A^*$. (Left $\mathcal{O}$-ideals are defined in a similar fashion.)

The right order of I is defined to be the set of elements in A which fix I under right multiplication.

right_order (R, basis) returns the right ideal of I in R given a basis for the right ideal I contained in the maximal order R.

ideal_classes(self) returns a tuple of all right ideal classes in self which, for the purpose of constructing the Brandt module B(p,M), is taken to be an Eichler order of level M.

The implementation of this method is especially interesting. It depends on the construction of a Hecke module defined as a free abelian group on right ideal classes of a quaternion algebra with the following action

where $(n, pM) = 1$ and the sum is over cyclic $\mathcal{O}$-module homomorphisms $\phi : I \to J `of degree` n$ up to isomorphism of J. Equivalently one can sum over the inclusions of the submodules $J \to n^{-1}I$. The rough idea is to start with the trivial ideal class containing the order $\mathcal{O}$ itself. Using the method cyclic_submodules(self, I, p) one computes $T_p([\mathcal{O}])$

for some prime integer \$p\$ not dividing the level of the order $\mathcal{O}$. Apply this method repeatedly and test for equivalence among resulting ideals. A theorem of Serre asserts that one gets a complete set of ideal class representatives after a finite number of repetitions.

One can prove that two ideals I and J are equivalent if and only if there exists an element $\alpha \in I\overline{J}$ such $N(\alpha) = N(I)N(J)$.

is_equivalent(I,J) returns true if I and J are equivalent. This method first compares the theta series of I and J. If they are the same, it computes the theta series of the lattice $I\bar{(}J)$. It returns true if the nth coefficient of this series is nonzero where $n = N(J)N(I)$.

The theta series of a lattice L over the quaternion algebra A is defined as

L.theta_series(T,q) returns a power series representing $\theta_L(q)$ up to a precision of $\mathcal{O}(q^{T+1})$.

Hecke Structure

The Hecke structure defined on the Brandt module is given by the Brandt matrices which can be computed using the definition of the Hecke operators given earlier.

hecke_matrix_from_defn (self,n) returns the matrix of the nth Hecke operator $B_0(n)$ acting on self, computed directly from the definition.

However, one can efficiently compute Brandt matrices using theta series. In fact, let $\{I_1, ..., I_h\}$ be a set of right $\mathcal{O}$-ideal class representatives. The (i,j) entry in the Brandt matrix $B_0(n)$ is the product of the nth coefficient in the theta series of the lattice $I_i\overline{I_j}$ and the first coefficient in the theta series of the lattice $I_i\overline{I_i}$.

compute_hecke_matrix_brandt(self,n) returns the nth Hecke matrix, computed using theta series.

Example

```
sage: B = BrandtModule(23)

sage: B.maximal_order()
Order of Quaternion Algebra (-1, -23) with base ring Rational Field with basis (1/2 + 1/2*j, 1/2*i +

sage: B.right_ideals()
(Fractional ideal (2 + 2*j, 2*i + 2*k, 4*j, 4*k), Fractional ideal (2 + 2*j, 2*i + 6*k, 8*j, 8*k), Fr

sage: B.hecke_matrix(2)
[1 2 0]
[1 1 1]
[0 3 0]

sage: B.brandt_series(3)
[1/4 + q + q^2 + O(q^3)      1/4 + q^2 + O(q^3)            1/4 + O(q^3)]
[  1/2 + 2*q^2 + O(q^3) 1/2 + q + q^2 + O(q^3)   1/2 + 3*q^2 + O(q^3)]
[          1/6 + O(q^3)      1/6 + q^2 + O(q^3)        1/6 + q + O(q^3)]
```

Further Examples

We decompose a Brandt module over both $\mathbf{Z}$ and $\mathbf{Q}$.:

```
sage: B = BrandtModule(43, base_ring=ZZ); B
Brandt module of dimension 4 of level 43 of weight 2 over Integer Ring
sage: D = B.decomposition()
sage: D
[
Subspace of dimension 1 of Brandt module of dimension 4 of level 43 of weight 2 over Integer Ring,
Subspace of dimension 1 of Brandt module of dimension 4 of level 43 of weight 2 over Integer Ring,
Subspace of dimension 2 of Brandt module of dimension 4 of level 43 of weight 2 over Integer Ring
]
sage: D[0].basis()
((0, 0, 1, -1),)
sage: D[1].basis()
((1, 2, 2, 2),)
sage: D[2].basis()
((1, 1, -1, -1), (0, 2, -1, -1))
sage: B = BrandtModule(43, base_ring=QQ); B
Brandt module of dimension 4 of level 43 of weight 2 over Rational Field
sage: B.decomposition()[2].basis()
((1, 0, -1/2, -1/2), (0, 1, -1/2, -1/2))
```

BrandtModule(*N, M=1, weight=2, base_ring=Rational Field, use_cache=True*)

Return the Brandt module of given weight associated to the prime power p^r and integer M, where p and M are coprime.

INPUT:
- N – a product of primes with odd exponents
- M – an integer coprime to q (default: 1)
- weight – an integer that is at least 2 (default: 2)
- base_ring – the base ring (default: QQ)
- use_cache – whether to use the cache (default: True)

OUTPUT:
- a Brandt module

EXAMPLES:

```
sage: BrandtModule(17)
Brandt module of dimension 2 of level 17 of weight 2 over Rational Field
sage: BrandtModule(17,15)
Brandt module of dimension 32 of level 17*15 of weight 2 over Rational Field
sage: BrandtModule(3,7)
Brandt module of dimension 2 of level 3*7 of weight 2 over Rational Field
sage: BrandtModule(3,weight=2)
Brandt module of dimension 1 of level 3 of weight 2 over Rational Field
sage: BrandtModule(11, base_ring=ZZ)
Brandt module of dimension 2 of level 11 of weight 2 over Integer Ring
sage: BrandtModule(11, base_ring=QQbar)
Brandt module of dimension 2 of level 11 of weight 2 over Algebraic Field
```

The use_cache option determines whether the Brandt module returned by this function is cached.:

```
sage: BrandtModule(37) is BrandtModule(37)
True
sage: BrandtModule(37,use_cache=False) is BrandtModule(37,use_cache=False)
False
```

TESTS:

Note that N and M must be coprime:

```
sage: BrandtModule(3,15)
...
ValueError: M must be coprime to N
```

Only weight 2 is currently implemented:

```
sage: BrandtModule(3,weight=4)
...
NotImplementedError: weight != 2 not yet implemented
```

Brandt modules are cached:

```
sage: B = BrandtModule(3,5,2,ZZ)
sage: B is BrandtModule(3,5,2,ZZ)
True
```

class BrandtModuleElement (*parent, x*)

monodromy_pairing (*x*)

Return the monodromy pairing of self and x.

EXAMPLES:

```
sage: B = BrandtModule(5,13)
sage: B.monodromy_weights()
(1, 3, 1, 1, 1, 3)
sage: (B.0 + B.1).monodromy_pairing(B.0 + B.1)
4
```

class BrandtModule_class (*N, M, weight, base_ring*)

A Brandt module.

EXAMPLES:

```
sage: BrandtModule(3, 10)
Brandt module of dimension 4 of level 3*10 of weight 2 over Rational Field
```

M ()

Return the auxiliary level (prime to p part) of the quaternion order used to compute this Brandt module.

EXAMPLES:

```
sage: BrandtModule(7,5,2,ZZ).M()
5
```

N ()

Return ramification level N.

EXAMPLES:

```
sage: BrandtModule(7,5,2,ZZ).N()
7
```

brandt_series (*prec, var='q'*)

Return matrix of power series $\sum T_n q^n$ to the given precision. Note that the Hecke operators in this series are always over $\mathbf{Q}$, even if the base ring of this Brandt module is not $\mathbf{Q}$.

INPUT:

- prec – positive intege
- var – string (default: q)

OUTPUT: matrix of power series with coefficients in **Q**

EXAMPLES:

```
sage: B = BrandtModule(11)
sage: B.brandt_series(2)
[1/4 + q + O(q^2)     1/4 + O(q^2)]
[    1/6 + O(q^2) 1/6 + q + O(q^2)]
sage: B.brandt_series(5)
[1/4 + q + q^2 + 2*q^3 + 5*q^4 + O(q^5)   1/4 + 3*q^2 + 3*q^3 + 3*q^4 + O(q^5)]
[  1/6 + 2*q^2 + 2*q^3 + 2*q^4 + O(q^5)         1/6 + q + q^3 + 4*q^4 + O(q^5)]
```

Asking for a smaller precision works.:

```
sage: B.brandt_series(3)
[1/4 + q + q^2 + O(q^3)   1/4 + 3*q^2 + O(q^3)]
[  1/6 + 2*q^2 + O(q^3)       1/6 + q + O(q^3)]
sage: B.brandt_series(3,var='t')
[1/4 + t + t^2 + O(t^3)   1/4 + 3*t^2 + O(t^3)]
[  1/6 + 2*t^2 + O(t^3)       1/6 + t + O(t^3)]
```

cyclic_supermodules(*I*, *p*)

Return a list of rescaled versions of the fractional right ideals J such that J contains I and the quotient has group structure the product of two cyclic groups of order p.

We emphasize again that J is rescaled to be integral.

INPUT: I – ideal I in R = self.order_of_level_N() p – prime p coprime to self.level()

OUTPUT: list of the p+1 fractional right R-ideals that contain I such that J/I is GF(p) x GF(p).

EXAMPLES:

```
sage: B = BrandtModule(11)
sage: I = B.order_of_level_N().unit_ideal()
sage: B.cyclic_supermodules(I, 2)
[Fractional ideal (1/2 + 3/2*j + k, 1/2*i + j + 1/2*k, 2*j, 2*k),
 Fractional ideal (1/2 + 1/2*i + 1/2*j + 1/2*k, i + k, j + k, 2*k),
 Fractional ideal (1/2 + 1/2*j + k, 1/2*i + j + 3/2*k, 2*j, 2*k)]
sage: B.cyclic_supermodules(I, 3)
[Fractional ideal (1/2 + 1/2*j, 1/2*i + 5/2*k, 3*j, 3*k),
 Fractional ideal (1/2 + 3/2*j + 2*k, 1/2*i + 2*j + 3/2*k, 3*j, 3*k),
 Fractional ideal (1/2 + 3/2*j + k, 1/2*i + j + 3/2*k, 3*j, 3*k),
 Fractional ideal (1/2 + 5/2*j, 1/2*i + 1/2*k, 3*j, 3*k)]
sage: B.cyclic_supermodules(I, 11)
...
ValueError: p must be coprime to the level
```

eisenstein_subspace()

Return the 1-dimensional subspace of self on which the Hecke operators T_p act as $p + 1$ for p coprime to the level.

NOTE: This function assumes that the base field has characteristic 0.

EXAMPLES:

```
sage: B = BrandtModule(11); B.eisenstein_subspace()
Subspace of dimension 1 of Brandt module of dimension 2 of level 11 of weight 2 over Rationa
sage: B.eisenstein_subspace() is B.eisenstein_subspace()
True
sage: BrandtModule(3,11).eisenstein_subspace().basis()
((1, 1),)
sage: BrandtModule(7,10).eisenstein_subspace().basis()
((1, 1, 1, 1/2, 1, 1, 1/2, 1, 1, 1),)
```

```
sage: BrandtModule(7,10,base_ring=ZZ).eisenstein_subspace().basis()
((2, 2, 2, 1, 2, 2, 1, 2, 2, 2),)
```

free_module()

Return the underlying free module of the Brandt module.

EXAMPLES:

```
sage: B = BrandtModule(10007,389)
sage: B.free_module()
Vector space of dimension 325196 over Rational Field
```

maximal_order()

Return a maximal order in the quaternion algebra associated to this Brandt module.

EXAMPLES:

```
sage: BrandtModule(17).maximal_order()
Order of Quaternion Algebra (-17, -3) with base ring Rational Field with basis (1/2 + 1/2*j,
sage: BrandtModule(17).maximal_order() is BrandtModule(17).maximal_order()
True
```

monodromy_weights()

Return the weights for the monodromy pairing on this Brandt module. The weights are associated to each ideal class in our fixed choice of basis. The weight of an ideal class $[I]$ is half the number of units of the right order I.

NOTE: The base ring must be $\mathbf{Q}$ or $\mathbf{Z}$.

EXAMPLES:

```
sage: BrandtModule(11).monodromy_weights()
(2, 3)
sage: BrandtModule(37).monodromy_weights()
(1, 1, 1)
sage: BrandtModule(43).monodromy_weights()
(2, 1, 1, 1)
sage: BrandtModule(7,10).monodromy_weights()
(1, 1, 1, 2, 1, 1, 2, 1, 1, 1)
sage: BrandtModule(5,13).monodromy_weights()
(1, 3, 1, 1, 1, 3)
```

order_of_level_N()

Return Eichler order of level N = p^(2*r+1)*M in the quaternion algebra.

EXAMPLES:

```
sage: BrandtModule(7).order_of_level_N()
Order of Quaternion Algebra (-1, -7) with base ring Rational Field with basis (1/2 + 1/2*j,
sage: BrandtModule(7,13).order_of_level_N()
Order of Quaternion Algebra (-1, -7) with base ring Rational Field with basis (1/2 + 1/2*j +
sage: BrandtModule(7,3*17).order_of_level_N()
Order of Quaternion Algebra (-1, -7) with base ring Rational Field with basis (1/2 + 1/2*j +
```

quaternion_algebra()

Return the quaternion algebra A over QQ ramified precisely at p and infinity used to compute this Brandt module.

EXAMPLES:

```
sage: BrandtModule(997).quaternion_algebra()
Quaternion Algebra (-2, -997) with base ring Rational Field
sage: BrandtModule(2).quaternion_algebra()
Quaternion Algebra (-1, -1) with base ring Rational Field
```

```
sage: BrandtModule(3).quaternion_algebra()
Quaternion Algebra (-1, -3) with base ring Rational Field
sage: BrandtModule(5).quaternion_algebra()
Quaternion Algebra (-2, -5) with base ring Rational Field
sage: BrandtModule(17).quaternion_algebra()
Quaternion Algebra (-17, -3) with base ring Rational Field
```

right_ideals(*B=None*)

Return sorted tuple of representatives for the equivalence classes of right ideals in self.

OUTPUT: • sorted tuple of fractional ideals

EXAMPLES:

```
sage: B = BrandtModule(23)
sage: B.right_ideals()
(Fractional ideal (2 + 2*j, 2*i + 2*k, 4*j, 4*k),
 Fractional ideal (2 + 2*j, 2*i + 6*k, 8*j, 8*k),
 Fractional ideal (2 + 10*j + 8*k, 2*i + 8*j + 6*k, 16*j, 16*k))
```

TEST:

```
sage: B = BrandtModule(1009)
sage: Is = B.right_ideals()
sage: n = len(Is)
sage: prod(not Is[i].is_equivalent(Is[j]) for i in range(n) for j in range(i))
1
```

class **BrandtSubmodule**(*ambient, submodule, dual_free_module=None, check=True*)

basis_for_left_ideal(*R, gens*)

Return a basis for the left ideal of R with given generators.

INPUT: • R – quaternion order
• gens – list of elements of R

OUTPUT: • list of four elements of R

EXAMPLES:

```
sage: B = BrandtModule(17); A = B.quaternion_algebra(); i,j,k = A.gens()
sage: sage.modular.quatalg.brandt.basis_for_left_ideal(B.maximal_order(), [i+j,i-j,2*k,A(3)])
[1/2 + 1/6*j + 2/3*k, 1/2*i + 1/2*k, 1/3*j + 1/3*k, k]
sage: sage.modular.quatalg.brandt.basis_for_left_ideal(B.maximal_order(), [3*(i+j),3*(i-j),6*k,A
[3/2 + 1/2*j + 2*k, 3/2*i + 3/2*k, j + k, 3*k]
```

benchmark_magma(*levels, silent=False*)

INPUT: • levels – list of pairs (p,M) where p is a prime not dividing M
• silent – bool, default False; if True suppress printing during computation

OUTPUT: • list of 4-tuples ('magma', p, M, tm), where tm is the CPU time in seconds to compute T2 using Magma

EXAMPLES:

```
sage: a = sage.modular.quatalg.brandt.benchmark_magma([(11,1), (37,1), (43,1), (97,1)])  # optic
('magma', 11, 1, ...)
('magma', 37, 1, ...)
('magma', 43, 1, ...)
('magma', 97, 1, ...)
sage: a = sage.modular.quatalg.brandt.benchmark_magma([(11,2), (37,2), (43,2), (97,2)])  # optic
```

```
('magma', 11, 2, ...)
('magma', 37, 2, ...)
('magma', 43, 2, ...)
('magma', 97, 2, ...)
```

benchmark_sage(*levels, silent=False*)

INPUT: • levels – list of pairs (p,M) where p is a prime not dividing M
• silent – bool, default False; if True suppress printing during computation

OUTPUT: • list of 4-tuples ('sage', p, M, tm), where tm is the CPU time in seconds to compute T2 using Sage

EXAMPLES:

```
sage: a = sage.modular.quatalg.brandt.benchmark_sage([(11,1), (37,1), (43,1), (97,1)])
('sage', 11, 1, ...)
('sage', 37, 1, ...)
('sage', 43, 1, ...)
('sage', 97, 1, ...)
sage: a = sage.modular.quatalg.brandt.benchmark_sage([(11,2), (37,2), (43,2), (97,2)])
('sage', 11, 2, ...)
('sage', 37, 2, ...)
('sage', 43, 2, ...)
('sage', 97, 2, ...)
```

class_number(*p, r, M*)

Return the class number of an order of level N = p^r*M in the quaternion algebra over QQ ramified precisely at p and infinity.

This is an implementation of Theorem 1.12 of [Pizer, 1980].

INPUT: • p – a prime
• r – an odd positive integer (default: 1)
• M – an integer coprime to q (default: 1)

OUTPUT: Integer

EXAMPLES:

```
sage: sage.modular.quatalg.brandt.class_number(389,1,1)
33
sage: sage.modular.quatalg.brandt.class_number(389,1,2)  # TODO -- right?
97
sage: sage.modular.quatalg.brandt.class_number(389,3,1)  # TODO -- right?
4892713
```

maximal_order(*A*)

Return a maximal order in the quaternion algebra ramified at p and infinity.

This is an implementation of Proposition 5.2 of [Pizer, 1980].

INPUT: • A – quaternion algebra ramified precisely at p and infinity

OUTPUT: • a maximal order in A

EXAMPLES:

```
sage: A = BrandtModule(17).quaternion_algebra()
sage: sage.modular.quatalg.brandt.maximal_order(A)
Order of Quaternion Algebra (-17, -3) with base ring Rational Field with basis (1/2 + 1/2*j, 1/2
```

quaternion_order_with_given_level(*A, level*)

Return an order in the quaternion algebra A with given level. (Implemented only when the base field is the rational numbers.)

INPUT: **level – The level of the order to be returned. Currently this is only implemented** when the level is divisible by at most one power of a prime that ramifies in this quaternion algebra.

EXAMPLES:

```
sage: from sage.modular.quatalg.brandt import quaternion_order_with_given_level, maximal_order
sage: A.<i,j,k> = QuaternionAlgebra(5)
sage: level = 2 * 5 * 17
sage: O = quaternion_order_with_given_level(A, level)
sage: M = maximal_order(A)
sage: L = O.free_module()
sage: N = M.free_module()
sage: print L.index_in(N) == level/5  #check that the order has the right index in the maximal o
True
```

right_order(*R, basis*)

Given a basis for a left ideal I, return the right order in the quaternion order R of elements such that I*x is contained in I.

INPUT:
- R – order in quaternion algebra
- basis – basis for an ideal I

OUTPUT:
- order in quaternion algebra

EXAMPLES:

We do a consistency check with the ideal equal to a maximal order.:

```
sage: B = BrandtModule(17); basis = sage.modular.quatalg.brandt.basis_for_left_ideal(B.maximal_o
sage: sage.modular.quatalg.brandt.right_order(B.maximal_order(), basis)
Order of Quaternion Algebra (-17, -3) with base ring Rational Field with basis (1/2 + 1/6*j + 2/
sage: basis
[1/2 + 1/6*j + 2/3*k, 1/2*i + 1/2*k, 1/3*j + 1/3*k, k]

sage: B = BrandtModule(17); A = B.quaternion_algebra(); i,j,k = A.gens()
sage: basis = sage.modular.quatalg.brandt.basis_for_left_ideal(B.maximal_order(), [i*j-j])
sage: sage.modular.quatalg.brandt.right_order(B.maximal_order(), basis)
Order of Quaternion Algebra (-17, -3) with base ring Rational Field with basis (1/2 + 1/2*i + 1/
```

FORTYEIGHT

HISTORY AND LICENSE

Sage was initially created by William Stein in 2004–2005, using Python, IPython, PARI, SWIG, Pyrex, NTL, and GMP. These programs are all open source and released under the GPL or a GPL-compatible license.

All Sage releases are released under the GPL. All documentation is released under the GNU Free Documentation License.

48.1 The GNU General Public License

Version 2, June 1991

```
Copyright (C) 1989, 1991 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA  02110-1301, USA

Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.
```

48.1.1 Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software–to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

48.1.2 Terms and Conditions For Copying, Distribution and Modification

1. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

   Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

2. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

   You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

   You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   (a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

   (b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

   (c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

3. These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

4. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

   (a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

   (b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

   (c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

   The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

   If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

5. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

6. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

7. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

8. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

9. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

10. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

    Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

11. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

1. Because the program is licensed free of charge, there is no warranty for the program, to the extent permitted by applicable law. Except when otherwise stated in writing the copyright holders and/or other parties provide the program "as is" without warranty of any kind, either expressed or implied, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. The entire risk as to the quality and performance of the program is with you. Should the program prove defective, you assume the cost of all necessary servicing, repair or correction.

2. In no event unless required by applicable law or agreed to in writing will any copyright holder, or any other party who may modify and/or redistribute the program as permitted above, be liable to you for damages, including any general, special, incidental or consequential damages arising out of the use or inability to use the program (including but not limited to loss of data or data being rendered inaccurate or losses sustained by you or third parties or a failure of the program to operate with any other programs), even if such holder or other party has been advised of the possibility of such damages.

End of Terms and Conditions

48.1.3 Appendix: How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
one line to give the program's name and a brief idea of what it
does.
Copyright (C) yyyy name of author

This program is free software; you can redistribute it and/or
modify it under the terms of the GNU General Public License as
published by the Free Software Foundation; either version 2 of the
License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but
WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU
General Public License for more details.

You should have received a copy of the GNU General Public License
along with this program; if not, write to the Free Software
Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA
02110-1301, USA.
```

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) yyyy name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type
'show w'.
This is free software, and you are welcome to redistribute it under
certain conditions; type 'show c' for details.
```

The hypothetical commands show w and show c should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than show w and show c; they could even be mouse-clicks or menu items–whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the
program
'Gnomovision' (which makes passes at compilers) written by James
Hacker.

signature of Ty Coon, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.
